

VCR Loading Operations

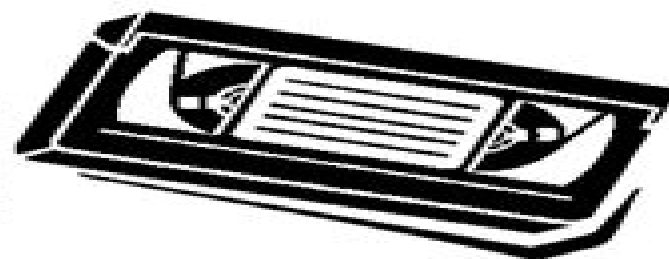

By Robert Epperson

Cassette Holder Control

When the mechanism state switch (S2104) is set to the *EJECT* position, the cassette holder mechanism is powered by the capstan motor, in order to carry out the cassette loading process. Both the speed and directional rotation of the capstan motor are controlled by the System Control Microprocessor.

As illustrated in *Figure 1*, capstan motor speed is determined by the two voltages applied to the capstan motor drive *IC81M*:

- Drive voltage applied to pin 5 from pin 27 of the Servo *IC601* during cassette loading and eject.
- Power supply voltage applied to pin 6. This voltage originates from pins 18 (*V.CAPST. CONT.*) as a PWM signal through Q872, LPP, Q873, and Q874. This voltage varies

during normal operational modes from 10v to 13v. During cassette loading and eject, it is fixed at 13v.

The rotational direction of the capstan motor is determined by the logic at pin 41 of the System Control Microprocessor, and applied to pin 22 of *IC81M*. The logic is *LOW* during cassette loading, and *HIGH* during *EJECT*. When the cassette loading or *EJECT* operation
