Automotive wiring harness assembly , A Novel Optimization Methodology of Modular Wiring Harnesses in Modern Vehicles : Weight Reduction and Safe Operation Armand Rius Rueda,2017 The weight of electric and electronic components of cars has been uninterruptedly increasing through the last decades and thus the weight of their wiring harnesses This fact has awakened the interest of car manufacturers on the weight and cost optimization of automotive wiring harnesses For this reason this dissertation discusses and develops approaches to reduce the amount of copper for the purpose of current conduction i e the cross sections of all of the wires of the car without endangering safety On the one hand harnesses must withstand continuous operation currents On account of this it is necessary to know the characteristic flow of current of the in vehicle electrical network Nevertheless the huge quantity of available combinations of equipment of the car produces a proportional variety of customer specific wiring hamesses and makes it unfeasible to simulate all of them This thesis points attention on specific segments of the wiring harnesses Some of them can have many possible compositions which are related to the customer s car settings Since computation time is a limiting factor here it is proposed to predict the bundle heating behaviors by means of response surfaces obtained from a set of finite element simulation results and the least squares method On the other hand the correct wire sizes must ensure that they are protected by their associated melting fuses so that their maximum acceptable temperature is not exceeded after short circuits Since many wires in cars are connected to other wires with splices or may suffer short circuits in their electric loads these short circuits can flow across different wires In modular wiring harnesses each of the wires can have different lengths and different installation ratios their cross section affects the cost of the wire harness with different importance as well as the short circuit and the final temperature of the wire The finite volume method is used to simulate the short circuit of series connected wires Finally non linear optimization is used to find the m nimum cross sections of wires respecting the constraints of maximum temperature and m nimum short circuit current Finally these two different criteria for optima wire dimensioning are combined in the analysis of the on board network of the vehicle in order to make a complete weight and cost minimization of the cable harnesses in a particular vehicle considering also its modularity of loads **Automotive Wiring** Dennis W. Parks,2011-12-08 Automotive wiring is a primary skill required for proper completion and safe operation of any custom build

whether it is a traditional custom hot rod or classic daily driver While restorers typically have the option of buying a new or reproduction wiring harness custom enthusiasts often have few options except to figure out how to do it themselves This book guides builders through every step from determining what components they need to selecting wire type and gauge methods of connection and other considerations The book includes numerous charts showing typical configurations and suggested installations A troubleshooting section lends a hand in tracking down the inevitable problems that can arise
