Mental Practice: Clinical and Experimental Research in Imagery and Action Observation Magdalena Ietswaart, Andrew J. Butler, Philip L.

Jackson, Martin Gareth Edwards, 2016-05-18 There is now strong evidence demonstrating that the brain simulates action and other functions Such action simulation can be evoked through conscious mental rehearsal of movement or imagery but also through passive action observation watching movements in others Furthermore there is evidence to suggest that mental rehearsal of movement or mental practice can produce improvements normally attributed to practising actual movements It is currently assumed that such improvements are due to neural activation associated with action simulation However the neuroscience of mental practice efficacy is still poorly understood The aim of this research topic is to clarify the underlying mechanisms of mental practice bringing evidence from cognitive neuroscience experimental neuropsychology sport and movement science and clinical neurology It also attempts to address confusion regarding the concepts of imagery and observation which has hampered the progression of mental practice research both scientifically and applied As well as reviews theoretical and position articles this research topic includes original neuroimaging experimental and patient research addressing among others the following issues Neuroimaging studies provide strong evidence for action simulation but the link to behavioural change and functional outcome is weak What is the evidence that mental practice efficacy is driven by neuroplasticity processes evoked by action simulation This research topic includes contributions on neural correlates and behaviour with regards to imagery and action observation Much of the mental practice efficacy evidence

comes from longstanding research within sport science. However, what does mental practice entail in these contexts and to what extent is it compatible with the cognitive neuroscience perspective of action simulation? This research topic will include contributions that consider both evidence and concepts with regards to imagery and action observation in an attempt to build an interdisciplinary consensus on the nature and application of mental practice. Mental practice is perceived as a promising motor rehabilitation technique, but critically, there is a lack of clarity or consensus on what mental practice treatment should entail. It is also not clear what are the most appropriate outcomes to measure imagery ability and cognitive or behavioural change following mental practice. A further important issue that needs consideration as part of this research topic is dosage, as it is currently unclear how much mental practice is appropriate and whether this depends on patient variables such as age, cognitive functioning, motor function or pathophysiology.

Actinobacteria in Special and Extreme Habitats: Diversity, Function, Roles and Environmental Adaptations Sheng Qin, Wen-Jun Li, Syed G. Dastager, Wael N. Hozzein, 2016-11-09

Actinobacteria are highly diverse prokaryotes that are ubiquitous in soil, freshwater and marine ecosystems. Although various studies have focused on the ecology of this phylum, data are still scant on the diversity, abundance and ecology of actinobacteria endemic to special and extreme environments such as gut, plant, alkaline, saline soil, deep sea sediments, hot springs and other habitats. Actinobacteria are well-known producers of a vast array of secondary metabolites, many of which have useful applications in medicine and agriculture. Furthermore, actinobacteria also have diverse functions in different environments apart from antibiotic production. For example, actinobacteria are reported to contribute to the break-down and recycling of organic compounds. They play a significant role in nitrogen fixation, plant growth, biodegradation, bioremediation and environmental protection. Therefore, understanding the actinobacterial diversity and distribution in such special environments is important in deciphering the ecological roles of these microorganisms and for biotechnological bioprospecting. Recent advances in cultivation, DNA sequencing technologies and omics (metagenomics, metaproteomics etc.) methods have greatly contributed to the rapid advancement of our understanding of microbial diversity, function and their interactions with environment. Furthermore, comparative genomic studies can provide overall information about actinobacterial speciation, evolution, metabolism and environment adaptation mechanisms. This research topic, comprising reviews and original articles, highlights the recent advances regarding the unexpectedly diverse, rare group of actinobacteria with special selective isolation methods or culture-independent methods, as well as their biological activities, ecophysiological function and mechanisms from diverse special and extreme environments.
