

C-ISG Crankshaft Integrated Starter Generator:

CISG is a permanently magnetised synchronous motor for 270-430 V alternating current and is located between the internal combustion engine and the gearbox. The synchronous motor's rotor is attached to the crankshaft. CISG is controlled by the IGM (Inverter Generator Module) section in CIDO and has three main functions:

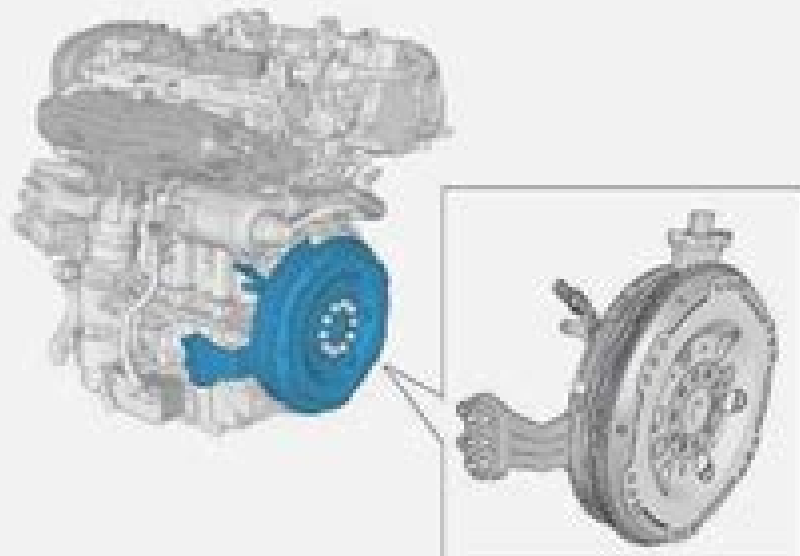

1. To act as the starter motor for the internal combustion engine.
2. To generate electricity for the high-voltage battery, ERAD (Electric Rear Axle Drive) and other current consumers in the high-voltage circuit.
3. Electric power boost for the internal combustion engine.

CISG is also used to increase exhaust temperature with the aim of heating the catalytic converter more quickly.

When CISG is used as a starter motor, a driving torque of $>180 \text{ Nm}$ is generated on the rotor by means of the stator windings being supplied with current so that the magnetic field drives the rotor.

CISG is used as a generator while driving because the Twin Engine does not have a conventional 12 V alternator. By controlling the transistors, 3-phase high-voltage AC voltage can be generated, which is converted to high-voltage DC voltage by IGM.

CISG can contribute a power boost to the internal combustion engine using the Fill in and Boost functions, which are dependent on the different drive modes. The power boost occurs in the event of a request for increased torque from ECM to IGM. The power boost primarily occurs indirectly by means of CISG stopping the generating, but CISG also applies it based on a driving torque situation. In the event of higher torque requests or a continuous requirement, all power output is transferred to ERAD.
