Zero Minus X:

Higher Engineering Mathematics N.B. Singh, Higher Engineering Mathematics is a comprehensive textbook designed to provide students and professionals with a solid foundation in advanced mathematical techniques essential for engineering and applied sciences The book covers a wide range of topics including differential equations Fourier series Laplace transforms and complex analysis with a focus on practical applications Each chapter introduces key concepts in a clear and approachable manner supported by worked examples and problems that demonstrate how these mathematical tools are used to solve real world engineering problems Through step by step explanations and illustrative examples this book ensures that complex mathematical ideas are accessible and understandable for readers at all levels *Language as Behaviour, Language as Code* Lynne Young,1991-03-15 This work arose from the desire to teach foreign students in North America a particular variety of language used in their disciplines speech situations whereupon the inadequacy or non existence of previous study became apparent Given this raison d tre the work first illustrates one approach to the analysis of language in order to test whether something of significance can be said about the typology of texts and discourse The approach chosen is Systemic Functional Grammar with its roots in the Prague School of Linguistics and the London School of J R Firth a theory that is particularly able to show how situational factors affect codal choices Secondly the author proceeds to use this theory and one language variety academic speech to illustrate the influence of speech situational components on the codal selections in the language variety Since the impetus for the work is pedagogical the book concludes with a brief reappraisal of the analysis model and a discussion of some of the pedagogical implications stemming from the analysis Since the work is also theoretical the implications of the study for the model of grammar are thoroughly explored Central European Functional Programming School Zoltán Horváth,2006-10-02 This volume presents eight carefully revised texts of selected lectures given by leading researchers of the field at the first Central European Functional Programming School CEFP 2005 held in Budapest Hungary in July 2005 The eight revised full papers presented were carefully selected during two rounds of reviewing and improvement for inclusion in the book The lectures cover a wide range of topics such as new programming language concepts for subtyping **Algebraic Foundations of Systems Specification** Egidio Astesiano,Hans-Jörg Kreowski,Bernd Krieg-Brückner,2012-12-06 The aim of software engineering is the provision and investigation of methods for the development of software systems of high quality with correctness as a key issue A system is called correct if it does what one wants if it meets the requirements To achieve and to guarantee correct systems the need of formal methods with rigorous semantics and the possibility of verification is widely accepted Algebraic specification is a software engineering approach of this perspective When Liskov and Zilles Guttag and the ADJ group with Goguen Thatch er Wagner and Wright introduced the basic ideas of algebraic specification in the mid seventies in the U S A and Canada they initiated a very successful and still flourishing new area In the late seventies algebraic specification became a major research topic also in

many European countries Originally the algebraic framework was intended for the mathematical foundation of ab stract data types and the formal development of first order applicative pro grams Meanwhile the range of applications has been extended to the precise specification of complete software systems the uniform definition of syntax and semantics of programming languages and to the stepwise development of correct systems from the requirement definitions to the running programs The activities in the last 25 years have led to an abundance of concepts methods approaches theories languages and tools which are mathemati cally founded in universal algebra category theory and logic   Types for Proofs and Programs Paul Callaghan,Zhaohui Luo,James McKinna,Robert Pollack,2003-08-03 This book constitutes the thoroughly refereed post proceedings of the International Workshop of the TYPES Working Group TYPES 2000 held in Durham UK in December 2000 The 15 revised full papers presented were carefully reviewed and selected during two rounds of refereeing and revision All current issues on type theory and type systems and their applications to programming systems design and proof theory are addressed   **Extensions of Logic Programming** Evelina Lamma,Paola Mello,1993-02-12 This book contains papers which investigate how to extend logic programming toward the artificial intelligence and software engineering areas covering both theoretical and practical aspects Some papers investigate topics such as abductive reasoning and negation Some works discuss how to enhance the expressive power of logic programming by introducing constraints sets and integration with functional programming Other papers deal with the structuring of knowledge into modules taxonomies and objects withthe aim of extending logic programming toward software engineering applications A section is devoted to papers concentrating on proof theory and inspired by Gentzen style sequent or natural deduction systems Topics such as concurrency are considered to enhance the expressive power of logic languages Finally some papers mainly concernimplementation techniques for some of these logic programming extensions   Package X United States.
