### Static Electricity

Grade 3-4

#### Materials

- Balloons – 1 per student
- Puffed rice cereal or plastic foam pellets
- Piece of wool
- \_\_ tsp of salt and \_\_ tsp of pepper – combined pile/student

#### Background

All materials contain millions of tiny particles, called protons and electrons that have electric charges. Protons have positive charges, and electrons negative ones. Typically, they balance each other, but sometimes when two surfaces rub together, some of the electrons rub off one surface onto the other, and we can have static electricity. Materials with like charges (all positive or all negative) move away from each other; those with opposite charges attract each other.

#### Introduction

What is static electricity?

Ask students if they've ever dragged their feet across the room. What happened when they touched something afterward? Did they ever:

- Give a shock to someone in their family?
- Receive a shock when they've touched something?

These are forms of static electricity. Static electricity is a form of energy. Energy can move to make things work. Since we are made up of mostly water, electricity can move through our body to try to get to the ground, and that's why we must act safely around electricity.

#### Static electricity application

Ask who has seen lightning during a storm. Lightning is a powerful form of static electricity. Just like when we shock someone, lightning is a shock from the clouds to the earth. Positive and negative charges move to make static electricity.

How does static electricity work?

*Perform an activity with students to explore charges and explain static electricity. Use a magnet if it helps demonstrate the concept.*

#### Procedure

**Step 1:** Have students blow up balloons and rub them with the piece of wool.

After the balloon has been rubbed, it becomes negatively charged.

**Step 2:** Have the students hold their balloons over the plastic foam pellets and observe what happens.
