Introduction:

Charles Darwin revolutionized evolutionary understanding from amongst the theory of evolution by natural selection. One of his difficulties in understanding the theory, however, was difficulty in understanding all evolutionary traits as direct potential ones, which could be understood in a way that played an action. Although Darwin was successful in understanding examples of evolution, which helped him to produce a general theory, some evolutionary traits of his were difficult to explain. Darwin's examples of evolution of the peppered moth offered him some.

The peppered moths have been used as an example of evolution in the light of the theory. There have been several theories proposed on the evolution of the peppered moth. The most common one is generally that the peppered moths evolved from the light-colored form. The peppered moths were first described in 1848, in a paper by W. H. Bates.
