Milos, 2013-03-09 Who owns your sex organs Different cultures today and in different epochs have given a variety of answers to this question It may seem self evident that every individual owns and has sovereignty over his or her own body parts such as the head legs nose stomach pancreas and other body parts The sex organs however seem to be an exception Even though they are as much an integral part of the individual as a leg or a liver the sex organs are unique in that many cultures have established laws and taboos over the use and even the mere display of the sex organs Thus certain cultures have placed constraints over the individual s ownership of his or her sex organs and actively regulate and restrict the individual s access and use of those organs In other cultures the question of ownership of the sex organs is more decisively answered In any culture where circumcision to any degree of either the male or female is practiced permitted encouraged or even merely tolerated it is clear that the individual is not considered to own his own sex organs In the United States today the medical establishment has created an is considered acceptable and desirable that anyone for environment where it any reason can authorize or execute the amputation of the foreskin from a male child s penis      **Mechanical Properties of Arteries**

Jan-Lucas Gade, 2021-01-27 In this dissertation a method is proposed that identifies the mechanical properties of arteries in vivo The mechanical properties of an artery are linked to the development of cardiovascular diseases The possibility to identify the mechanical properties of an artery inside the human body could thus facilitate disease diagnostization treatment and monitoring Supplied with information obtainable in the clinic typically limited to time resolved pressure radius measurement pairs the proposed in vivo parameter identification method solves a non convex minimization problem to determine parameters related to the mechanical properties of the blood vessel The artery is treated as a homogeneous incompressible residual stress free thin walled tube consisting of an elastin dominated matrix with embedded collagen fibers To validate the in vivo parameter identification method in silico arteries in the form of finite element models are created using published data for the human abdominal aorta With these in silico arteries which serve as mock experiments with pre defined material parameters and boundary conditions in vivo like pressure radius data sets are generated The mechanical properties of the in silico arteries are then determined using the proposed parameter identification method By comparing the identified and the pre defined parameters the identification method is quantitatively validated and it is shown that the parameters agree well for healthy arteries Furthermore the identified parameters are used to compare the stress state in the arterial model and in the in silico arteries The stress state is thereby decomposed into an isotropic and an anisotropic component which are primarily associated with the elastin dominated matrix and the collagen fibers respectively The comparison of the decomposed stress states shows a close agreement for arteries exhibiting a physiological stress gradient Another important aspect is the identification of parameters by solving a non convex minimization problem The non convexity of the problem implies that incorrect parameter values corresponding to local minima may be found when common gradient

based solution techniques are employed A problem specific global algorithm based on the branch and bound method is therefore created which ensures that the global minimum and accordingly the correct parameters are obtained It turns out that the gradient based solution technique identifies the correct parameters if certain requirements are met among others the use of the heuristic multi start method In a last step the in vivo parameter identification method is extended to also identify parameters related to smooth muscle contraction To prevent an overparameterization caused by the increased number of model parameters the model is simultaneously fit to clinical data measured during three different arterial conditions basal constricted and dilated Despite the simple contraction model the extended method fits the clinical data well Finally in this dissertation it is shown that the proposed in vivo parameter identification method identifies the mechanical properties of arteries well An open question for future research is how this method can be applied in a clinical setting to facilitate cardiovascular disease diagnosis treatment and monitoring
