(1) Speedometer. A speedometer (FIG. 1) is used to indicate vehicle speed in miles per hour as shown by the pointer and face dial, and to record distance traveled by means of an odometer. A speedometer is driven by a flexible shaft connected to a set of gears in the vehicle transmission (FIGS. 2A and 2B). These gears are designed for

the particular vehicle model and take into consideration the tire size and rear axle ratio. The flexible shaft which connects the transmission driven gear to the speedometer consists of an outer casing and the inner drive core (FIG. 3). The total odometer usually records up to 99,999 miles before it automatically returns to zero. The trip odometer usually registers up to 999.9 miles, and by means of a trip reset lever it can be reset to zero or any intermediate figure as desired. Some speedometers are not equipped with a trip odometer. These units have an extra wheel or tenth dial at the right of the total odometer.

(2) Tachometer. A magnetic type tachometer (FIG. 4) is similar to a speedometer, except that the face dial indicates in revolutions per minute (instead of miles per hour) and is ordinarily used to indicate vehicle engine speed. A tachometer is driven by a flexible shaft which is usually connected to the vehicle generator shaft, crankshaft or distributor shaft by means of a drive point. An odometer is often incorporated in a tachometer to record total crankshaft revolutions, which are translated into motor miles.
