IUTAM Symposium on Transformation Problems in Composite and Active Materials Yehia A. Bahei-El-Din, George J. Dvorak, 2006-04-11 The field of composite materials has seen substantial development in the past decade New composite systems are being continually developed for various applications Among such systems are metal intermetallic and superalloy matrix composites carbon carbon composites as well as polymer matrix composites At the same time a new discipline has emerged of active or smart materials which are often constructed as composite or heterogeneous media and structures One unifying theme in these diverse systems is the influence that uncoupled and coupled eigenfields or transformation fields exert on the various types of overall response as well as on the respective phase responses Problems of this kind are currently considered by different groups which may not always appreciate the similarities of the problems involved The purpose of the IUTAM Symposium on Transformation Problems in Composite and Active Materials held in Cairo Egypt from March 10 to 12 1997 was to bring together representatives of the different groups so that they may interact and explore common aspects of these seemingly different problem areas New directions in micromechanics research in both composite and active materials were also explored in the symposium Specifically invited lectures in the areas of inelastic behavior of composite materials shape memory effects functionally graded materials transformation problems in composite structures and adaptive structures were delivered and discussed during the three day meeting This book contains the printed contributions to the IUTAM Symposium

Meshless Methods in Solid Mechanics Youping Chen, James Lee, Azim Eskandarian, 2006-12-31 Finite element method has been the dominant technique in computational mechanics in the past decades and it has made significant contributions to the developments in engineering and science Nevertheless FEM is not well suited to problems having severe mesh distortion owing to extremely large deformations of materials encountering moving discontinuities such as crack propagation along arbitrary and complex paths involving considerable meshings and remeshings in structural optimization problems or having multidomain of influence in multiphenomena physical problems It is impossible to completely overcome those mesh related difficulties by a mesh based method The highly structured nature of finite element approximations imposes severe penalties in seeking the solutions of those problems Distinguishing with finite element finite difference and finite volume methods meshless method discretizes the continuum body only with a set of nodal points and the approximation is constructed entirely in terms of nodes There is no need of mesh or elements in this method It does not possess the mesh related difficulties and provides an approach with more flexibility in the applications in engineering and science The meshless method started to capture the interest of a broader community of researchers only several years ago and now it becomes a growing and evolving field It is showing that this is a very rich area to be explored and has great promise for many very challenging computational problems On the one hand great advances of meshless methods have been achieved On the other hand there are many aspects of meshless methods that could benefit from improvements A

broader community of researchers can bring diverse skills and backgrounds to bear on the task of improving this method
