Radiation in Enclosures Aristide Mbiok, Roman Weber, 2012-12-06 During the last half century the development and

testing of prediction models of combustion chamber performance have been an ongoing task at the International Flame Research Foundation IFRF in IJmuiden in the Netherlands and at many other research organizations This task has brought forth a hierarchy of more or less standard numerical models for heat transfer predictions in particular for the prediction of radiative heat transfer Unfortunately all the methods developed which certainly have a good physical foundation are based on a large number of extreme simplifications or uncontrolled assumptions To date the ever more stringent requirements for efficient production and use of energy and heat from combustion chambers call for prediction algorithms of higher accuracy and more detailed radiative heat transfer calculations The driving forces behind this are advanced technology requirements the costs of large scale experimental work and the limitation of physical modeling This interest is growing more acute and has increased the need for the publication of a textbook for more accurate treatment of radiative transfer in enclosures The writing of a textbook on radiative heat transfer however in addition to working regularly on other subjects is a rather difficult task for which some years of meditation are necessary The book must satisfy two requirements which are not easily reconciled From the mathematical point of view it must be written in accordance with standards of mathematical rigor and precision
