It is an excellent text for use as a first course in Control Systems by undergraduate students in all branches of engineering and applied mathematics. The book contains a comprehensive coverage of automatic control integrating digital and computer control techniques and their implementations, the practical issues and problems in Control System design, the three term PID controller, the most widely used controller in industry today, numerous in chapter worked examples and end of chapter exercises. This second edition also includes an introductory guide to some more recent developments, namely fuzzy logic control and neural networks.

Control Systems Rao V. Dukkipati, 2005 Discusses in a concise but thorough manner fundamental statement of the theory, principles and methods for the analysis and design of control systems and their applications to real life practical control systems problems. This book includes concepts and review of classical matrix analysis, Laplace transforms, modeling of mechanical and electrical.

Linear Control System Analysis and Design with MATLAB®, Sixth Edition Constantine H. Houppis, Stuart N. Sheldon, 2013-10-30 Thoroughly classroom tested and proven to be a valuable self study companion. Linear Control System Analysis and Design Sixth Edition provides an intensive overview of modern control theory and conventional control system design using in depth explanations, diagrams, calculations and tables. Keeping mathematics to a minimum, the book is designed with the undergraduate in mind, first building a foundation, then bridging the gap between control theory and its real world application. Computer aided design accuracy checks, CADAC, are used throughout the text to enhance computer literacy. Each CADAC uses fundamental concepts to ensure the viability of a computer solution. Completely updated and packed with student friendly features, the sixth edition presents a range of updated examples using MATLAB as well as an appendix listing MATLAB functions for optimizing control system analysis and design. Over 75 percent of the problems presented in the previous edition have been revised or replaced.

Dynamic Systems Biology Modeling and Simulation Joseph DiStefano III, 2015-01-10. *Dynamic Systems Biology Modeling and Simulation* consolidates and unifies classical and contemporary multiscale methodologies for mathematical modeling and computer simulation of dynamic biological systems from molecular cellular organ system on up to population levels. The book pedagogy is developed as a well annotated systematic tutorial with clearly spelled out and unified nomenclature derived from the author's own modeling efforts, publications and teaching over half a century. Ambiguities in some concepts and tools are clarified and others are rendered more accessible and practical. The latter include novel qualitative theory and methodologies for recognizing dynamical signatures in data using structural multicompartmental and network models and graph theory and analyzing structural and measurement data models for quantification feasibility. The level is basic to intermediate with much emphasis on biomodeling from real biodata for use in real applications. Introductory coverage of core mathematical concepts such as linear and nonlinear differential and difference equations, Laplace transforms, linear algebra, probability, statistics and stochastics topics. The pertinent biology, biochemistry, biophysics or pharmacology for modeling are provided to support understanding the amalgam of math modeling with life sciences. Strong emphasis on quantifying as well as building and analyzing biomodels includes methodology and computational tools for parameter identifiability and sensitivity analysis, parameter estimation from real data, model distinguishability and simplification and practical bioexperiment design and optimization. Companion website provides solutions and program code for examples and exercises using Matlab, Simulink, VisSim, SimBiology, SAAMII, AMIGO, Copasi and SBML coded models. A full set of PowerPoint slides are available from the author for teaching from his textbook. He uses them to teach a 10 week quarter upper division course at UCLA which meets twice a week so there are 20 lectures. They can easily be augmented or stretched for a 15 week semester course. Importantly the slides are editable so they can be readily adapted to a lecturer's personal style and course content needs. The lectures are based on excerpts from 12 of the first 13 chapters of DSBMS. They are designed to highlight the key course material as a study guide and structure for students following the full text content. The complete PowerPoint slide package (25 MB) can be obtained by instructors or prospective instructors by emailing the author directly at joed@cs.ucla.edu.
