Hard-to-Measure Goods and Services Ernst R. Berndt,Charles R. Hulten,2009-02-15 The celebrated

economist Zvi Griliches's entire career can be viewed as an attempt to advance the cause of accuracy in economic measurement. His interest in the causes and consequences of technical progress led to his pathbreaking work on price hedonics, now the principal analytical technique available to account for changes in product quality. *Hard to Measure Goods and Services*, a collection of papers from an NBER conference held in Griliches's honor, is a tribute to his many contributions to current economic thought. Here leading scholars of economic measurement address issues in the areas of productivity, price hedonics, capital measurement, diffusion of new technologies, and output and price measurement in hard-to-measure sectors of the economy. Furthering Griliches's vital work that changed the way economists think about the U.S. National Income and Product Accounts, this volume is essential for all those interested in the labor market, economic growth, production, and real output.

Automatic Differentiation in MATLAB Using ADMAT with Applications Thomas F. Coleman, Wei Xu, 2016-06-20

The calculation of partial derivatives is a fundamental need in scientific computing. Automatic differentiation (AD) can be applied straightforwardly to obtain all necessary partial derivatives, usually first and possibly second derivatives, regardless of a code's complexity. However, the space and time efficiency of AD can be dramatically improved, sometimes transforming a problem from intractable to highly feasible, if inherent problem structure is used to apply AD in a judicious manner. *Automatic Differentiation in MATLAB using ADMAT with Applications* discusses the efficient use of AD to solve real problems, especially multidimensional zero finding and optimization in the MATLAB environment. This book is concerned with the determination of the first and second derivatives in the context of solving scientific computing problems, with an emphasis on optimization and solutions to nonlinear systems. The authors focus on the application rather than the implementation of AD, solve real nonlinear problems with high performance by exploiting the problem structure in the application of AD, and provide many easy-to-understand applications, examples, and MATLAB templates.

Nonlinear Programming Mokhtar S. Bazaraa, Hanif D. Sherali, C. M. Shetty, 2006-05-05

COMPREHENSIVE COVERAGE OF NONLINEAR PROGRAMMING THEORY AND ALGORITHMS THOROUGHLY REVISED AND EXPANDED

Nonlinear Programming Theory and Algorithms now in an extensively updated Third Edition addresses the problem of optimizing an objective function in the presence of equality and inequality constraints. Many realistic problems cannot be adequately represented as a linear program owing to the nature of the nonlinearity of the objective function and/or the nonlinearity of any constraints. The Third Edition begins with a general introduction to nonlinear programming with illustrative examples and guidelines for model construction. Concentration on the three major parts of nonlinear programming is provided: Convex analysis with discussion of topological properties of convex sets, separation, and support of convex sets; polyhedral sets, extreme points, and extreme directions of polyhedral sets; and linear programming.

Optimality conditions and duality with coverage of the nature interpretation and value of the classical Fritz John FJ and the Karush Kuhn Tucker KKT optimality conditions the interrelationships between various proposed constraint qualifications and Lagrangian duality and saddle point optimality conditions Algorithms and their convergence with a presentation of algorithms for solving both unconstrained and constrained nonlinear programming problems Important features of the Third Edition include New topics such as second interior point methods nonconvex optimization nondifferentiable optimization and more Updated discussion and new applications in each chapter Detailed numerical examples and graphical illustrations Essential coverage of modeling and formulating nonlinear programs Simple numerical problems Advanced theoretical exercises The book is a solid reference for professionals as well as a useful text for students in the fields of operations research management science industrial engineering applied mathematics and also in engineering disciplines that deal with analytical optimization techniques The logical and self contained format uniquely covers nonlinear programming techniques with a great depth of information and an abundance of valuable examples and illustrations that showcase the most current advances in nonlinear problems
