Rising Seas Vivien Gornitz, 2013-03-19 The Earth's climate is already warming due to increased concentrations of human produced greenhouse gases in the atmosphere and the specter of rising sea level is one of global warming's most far reaching threats Sea level will keep rising long after greenhouse gas emissions have ceased because of the delay in penetration of surface warming to the ocean depths and because of the slow dissipation of excess atmospheric carbon dioxide Adopting a long perspective that interprets sea level changes both underway and expected in the near future Vivien Gornitz completes a highly relevant and necessary study of an unprecedented age in Earth's history Gornitz consults past climate archives to help better anticipate future developments and prepare for them more effectively She focuses on several understudied historical events including the Paleocene Eocene Thermal Anomaly the Messinian salinity crisis the rapid filling of the Black Sea which may have inspired the story of Noah's flood and the Storrega submarine slide an incident

possibly connected to a sea level occurrence roughly 8 000 years old By examining dramatic variations in past sea level and climate Gornitz concretizes the potential consequences of rapid human induced warming She builds historical precedent for coastal hazards associated with a higher ocean level such as increased damage from storm surge flooding even if storm characteristics remain unchanged Citing the examples of Rotterdam London New York City and other forward looking urban centers that are effectively preparing for higher sea level Gornitz also delineates the difficult economic and political choices of curbing carbon emissions while underscoring through past geological analysis the urgent need to do so Sedimentology and Stratigraphy Gary Nichols,2013-04-30 This fully revised and updated edition introduces the reader to sedimentology and stratigraphic principles and provides tools for the interpretation of sediments and sedimentary rocks The processes of formation transport and deposition of sediment are considered and then applied to develop conceptual models for the full range of sedimentary environments from deserts to deep seas and reefs to rivers Different approaches to using stratigraphic principles to date and correlate strata are also considered in order to provide a comprehensive introduction to all aspects of sedimentology and stratigraphy The text and figures are designed to be accessible to anyone completely new to the subject and all of the illustrative material is provided in an accompanying CD ROM High resolution versions of these images can also be downloaded from the companion website for this book at www.wiley.com/go/nicholssedimentology Surfing Douglas G.
