Programming Hint 1: It's dangerous to signal events from commands, as you might cause a very long call loop, corrupt memory and crash your program.

Programming Hint 2: Keep tasks short.

Programming Hint 3: Keep code synchronous when you can. Code should be `async` only if its timing is very important or if it might be used by something whose timing is important.

Programming Hint 4: Keep `atomic` sections short, and have as few of them as possible. Be careful about calling out to other components from within an atomic section.

Programming Hint 5: Only one component should be able to modify a pointer's data at any time. In the best case, only one component should be storing the pointer at any time.
