Manufacturing Execution System - MES Jürgen Kletti, 2007-05-01 The transformation of the classic factory from a production facility into a modern service center has resulted in management problems for which many companies are not yet prepared The economic efficiency of modern value creation is not a property of the products but rather of the process What this means is that the decisive potentials of companies are to be found not so much in their production capability but in their process capability For

manufacturers the requirement for process capability which has in the meantime become the basis of the certification codes gives rise in turn to the requirement that all value adding processes be geared to the process result and thus to the customer. A necessary condition of process transparency is the ability to map the company's value stream in real time without the acquisition process involving major outlay. A capability which is beyond the dominant ERP systems. Today modern manufacturing execution systems MES can offer real time applications. They generate current and even historical maps for production equipment and can thus be used as a basis for optimization processes. As early as the beginning of the 1980s work started on methods of this kind which were then known as production data acquisition or machine data collection. But while the main emphasis in the past was on achieving improvements in machine utilization today the concern is predominantly to obtain real time mapping of the value stream supply chain.

The Plant Viruses B.D. Harrison, A.F. Murrant, 2013-06-29 This fifth volume in the series The Plant Viruses dealing with viruses with bipartite genomes completes the coverage of viruses with isometric particles and genomes consisting of single stranded positive sense RNA viruses that have tripartite and monopartite genomes of this kind were dealt with in Volumes 1 and 3 respectively How close are the affinities among the viruses within the groupings distinguished in this way All those with tripartite genomes are considered to be sufficiently closely related to be included in the family Bromoviridae whereas the monopartite

genome viruses covered in Volume 3 clearly are a much more diverse collection Affinities among the viruses with bipartite genomes are considered in Chapter 1 of this volume along with the possible origins advantages and disadvantages of these genomes The conclusion reached from this assessment is that the bipartite genome viruses fall into four categories those within each category having closer affinities with viruses not included in this book than with viruses in the other categories No evidence was found that possession of a bipartite genome gives a virus overwhelming advantages over viruses of other sorts More probably any advantages are largely balanced by disadvantages and bipartite genomes may be best considered simply as an alternative design for the hereditary material of a virus
