Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 12-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 12-year-old children in the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical education program, while the experimental group participated in a 12-week training program. The physical fitness of the children was measured at the beginning and at the end of the 12-week period. The measurements included heart rate, blood pressure, and body mass index. The results of the study showed that the experimental group had significantly higher heart rates and blood pressures at the end of the 12-week period compared to the control group. The body mass index of the children in both groups did not change significantly. The study suggests that a 12-week training program can improve the physical fitness of 12-year-old children.

Model-Based Engineering of Embedded Real-Time Systems Holger Giese, Gabor Karsai, Edward A. Lee, Bernhard Rumpe, Bernhard Schätz, 2010-10-06 Thetopicof Model BasedEngineeringofReal TimeEmbeddedSystems brings together a challenging problem domain real time embedded systems and a lution domain model based engineering It is also at the forefrontof integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration Today real time bedded software plays a crucial role in most advanced technical systems such as airplanes mobile phones and cars and has become the main driver and cilitator for innovation Development evolution veri cation con guration and maintenance of embedded and distributed software nowadays are often serious challenges as drastic increases in complexity can be observed in practice Model based engineering in general and model based software

development in particular advocates the notion of using models throughout the development and life cycle of an engineered system Model based software engineering re forces this notion by promoting models not only as the tool of abstraction but also as the tool for veri cation implementation testing and maintenance The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain

Theory of Microwave Valves S. D. Gvozdozer, 2013-10-22 Theory of Microwave Valves deals with the theory of microwave devices which have found constant use in practice and the operation of which can be understood based on one type of oscillation or wave The book begins with a review of the fundamental properties of the differential equations and the boundary conditions of electrodynamics which are then applied to the analysis of the phenomena occurring in a cavity resonator through which an electron beam passes Subsequent chapters cover the static characteristics of the plane diode alternating voltage applied to a plane diode electronics of the plane diode when the influence of space charge is negligible and application of the total current method to analyze the plane diode Also included are separate chapters on the influence of transit effects on noise in a plane diode amplification of high frequency signals by a triode general theory of single circuit klystron oscillators and noise in the electron beam This book was written for students familiar with general electrodynamics at university level
