**The Horseless Age** ,1912      Aerial Manipulation Matko Orsag,Christopher Korpela,Paul Oh,Stjepan Bogdan,2017-09-19 This text is a thorough treatment of the rapidly growing area of aerial manipulation It details all the design steps required for the modeling and control of unmanned aerial vehicles UAV equipped with robotic manipulators Starting with the physical basics of rigid body kinematics the book gives an in depth presentation of local and global coordinates together with the representation of orientation and motion in fixed and moving coordinate systems Coverage of the kinematics and dynamics of unmanned aerial vehicles is developed in a succession of popular UAV configurations for multirotor systems Such an arrangement supported by frequent examples and end of chapter exercises leads the reader from simple to more complex UAV configurations Propulsion system aerodynamics essential in UAV design is analyzed through blade element and momentum theories analysis which is followed by a description of drag and ground aerodynamic effects The central part of the book is dedicated to aerial manipulator kinematics dynamics and control Based on foundations laid in the opening chapters this portion of the book is a structured presentation of Newton Euler dynamic modeling that results in

forward and backward equations in both fixed and moving coordinate systems The Lagrange Euler approach is applied to expand the model further providing formalisms to model the variable moment of inertia later used to analyze the dynamics of aerial manipulators in contact with the environment Using knowledge from sensor data insights are presented into the ways in which linear robust and adaptive control techniques can be applied in aerial manipulation so as to tackle the real world problems faced by scholars and engineers in the design and implementation of aerial robotics systems The book is completed by path and trajectory planning with vision based examples for tracking and manipulation **ASME Transactions**
