

- The particles in a gas are more spread out than the particles in a liquid and have less attractive forces acting between them; so, if the same amount of energy is transferred to a gas as to a liquid, the kinetic energy of the particles in a gas will increase more than the kinetic energy of particles in a liquid.

- Students should defend their answers. A heavy cast iron skillet transfers heat evenly, resists temperature changes, and is slow to heat. A thin stainless steel skillet transfers heat quickly, has a high surface temperature directly over the flame, and cools quickly.

SECTION: USING HEAT

- A damp towel has water that absorbs heat energy and evaporates as the air blows through it. Because the air loses heat energy to the water, the air is cooler.
- No, the refrigerator releases heat from inside the box out the back of the unit. The refrigerator is in the room, so the heat is still released in the kitchen.
 - Yes, because shivering causes muscle movements that generate heat.
 - Yes, because the large ears of a jackrabbit act as radiators to radiate heat from the rabbit's blood.
- The two objects that will be at different temperatures, such as an inside wall and an outside wall, should be separated by an air-filled space so that they are not touching, in order to eliminate heat loss by conduction.
- A diesel engine does not use spark plugs. Instead, it compresses the fuel-air mixture so much that a spark is ignited.
