Solution and Answer Guide: Skoog et al., *Fundamentals of Analytical Chemistry*, 10e,
© 2022, 978-0-357-45039-0, Chapter 11: Titrations in Analytical Chemistry

Chapter 11

11-1. Define

Answers:

*(a) millimole.

The millimole is the amount of an elementary species, such as an atom, an ion, a molecule, or an electron. A millimole contains

$$6.02 \times 10^{23} \frac{\text{particles}}{\text{mol}} \times \frac{\text{mmol}}{1000 \text{ mol}} = 6.02 \times 10^{20} \frac{\text{particles}}{\text{mmol}}$$

(b) titration.

A titration measures the quantity of a reagent of known concentration required to react with a measured quantity of sample of an unknown concentration. The concentration of the sample is then determined from the quantities of reagent and sample, the concentration of the reagent, and the stoichiometry of the reaction.

*(c) stoichiometric ratio.

The stoichiometric ratio is the molar ratio of two chemical species that appear in a balanced chemical equation.

(d) titration error.

Titration error is the error encountered in titrimetry that arises from the difference between the amount of reagent required to give a detectable end point and the theoretical amount for reaching the equivalence point.

11-2. Write two equations that—along with the stoichiometric factor—form the basis for the calculations of volumetric titrations.

Solution:

$$\text{amount A (mmol)} = \text{volume (mL)} \times c_A \text{ (mmol A/mL)}$$

$$\text{amount A (mmol)} = \frac{\text{mass A (g)}}{\text{millimolar mass A (g/mmol)}}$$

A Practical Guide to Geometric Regulation for Distributed Parameter Systems Eugenio Aulisa, David Gilliam, 2015-06-18 A Practical Guide to Geometric Regulation for Distributed Parameter Systems provides an introduction to geometric control design methodologies for asymptotic tracking and disturbance rejection of infinite dimensional systems The book also introduces several new control algorithms inspired by geometric invariance and asymptotic attraction for a wide range of dynamical control systems The first part of the book is devoted to regulation of linear systems beginning with the mathematical setup general theory and solution strategy for regulation problems with bounded input and output operators The book then considers the more interesting case of unbounded control and sensing Mathematically this case is more complicated and general theorems in this area have become available only recently The authors also provide a collection of interesting linear regulation examples from physics and engineering The second part focuses on regulation for nonlinear systems It begins with a discussion of theoretical results characterizing solvability of nonlinear regulator problems with bounded input and output operators The book progresses to problems for which the geometric theory based on center manifolds does not directly apply The authors show how the idea of attractive invariance can be used to solve a series of increasingly complex regulation problems The book concludes with the solutions of challenging nonlinear regulation examples from physics and engineering
