C. Fung, 2013-06-29 The motivation for writing a series of books on biomechanics is to bring this rapidly developing subject to students of bioengineering physiology and mechanics In the last decade biomechanics has become a recognized discipline offered in virtually all universities Yet there is no adequate textbook for instruction neither is there a treatise with sufficiently broad coverage A few books bearing the title of biomechanics are too elementary others are too specialized I have long felt a need for a set of books that will inform students of the physiological and medical applications of biomechanics and at the same time develop their training in mechanics We cannot assume that all students come to biomechanics already fully trained in fluid and solid mechanics their knowledge in these subjects has to be developed as the course proceeds The scheme adopted in the present series is as follows First some basic training in mechanics to a level about equivalent to the first seven chapters of the author's *A First Course in Continuum Mechanics* Prentice Hall Inc 1977 is assumed We then present some essential parts of biomechanics from the point of view of

bioengineering physiology and medical applications In the meantime mechanics is developed through a sequence of problems and examples The main text reads like physiology while the exercises are planned like a mechanics textbook The instructor may fill a dual role teaching an essential branch of life science and gradually developing the student's knowledge in mechanics
