An Introduction to Partial Differential Equations with MATLAB Matthew P. Coleman, Vladislav Bukshtynov, 2024-08-01. The first two editions of An Introduction to Partial Differential Equations with MATLAB gained popularity among instructors and students at various universities throughout the world. Plain mathematical language is used in a friendly manner to provide a basic introduction to partial differential equations (PDEs). Suitable for a one or two semester introduction to PDEs and Fourier series, the book strives to provide physical, mathematical, and historical motivation for each topic. Equations are studied based on method of solution rather than on type of equation. This third edition of this popular

textbook updates the structure of the book by increasing the role of the computational portion compared to previous editions. The redesigned content will be extremely useful for students of mathematics, physics, and engineering who would like to focus on the practical aspects of the study of PDEs without sacrificing mathematical rigor. The authors have maintained flexibility in the order of topics. In addition, students will be able to use what they have learned in some later courses for example, courses in numerical analysis, optimization, and PDE based programming. Included in this new edition is a substantial amount of material on reviewing computational methods for solving ODEs symbolically and numerically, visualizing solutions of PDEs using MATLAB's symbolic programming toolbox, and applying various schemes from numerical analysis along with suggestions for topics of course projects. Students will use sample MATLAB or Python codes available online for their practical experiments and for completing computational lab assignments and course projects.

Agent_Zero Joshua M. Epstein, 2014-02-23. The Final Volume of the Groundbreaking Trilogy on Agent Based Modeling. In this pioneering synthesis, Joshua Epstein introduces a new theoretical entity, Agent_Zero. This software individual or agent is endowed with distinct emotional, affective, cognitive, deliberative, and social modules. Grounded in contemporary neuroscience, these internal components interact to generate observed, often far from rational, individual behavior. When multiple agents of this new type move and interact spatially, they collectively generate an astonishing range of dynamics spanning the fields of social conflict, psychology, public health, law, network science, and economics. Epstein weaves a computational tapestry with threads from Plato, Hume, Darwin, Pavlov, Smith, Tolstoy, Marx, James, and Dostoevsky, among others. This transformative synthesis of social philosophy, cognitive neuroscience, and agent based modeling will fascinate scholars and students of every stripe. Epstein's computer programs are provided in the book or on its Princeton University Press website, along with movies of his computational parables. Agent_Zero is a signal departure in what it includes (e.g., a new synthesis of neurally grounded internal modules) and what it eschews (e.g., standard behavioral imitation). The phenomena it generates, from genocide to financial panic, and the modeling arsenal it offers the scientific community, for generative social science, Agent_Zero presents a groundbreaking vision and the tools to realize it.
