Methods of Solving Solid Geometry Problems Ellina Grigorieva, 2025-09-26 This textbook completes the author's series of books on solving complex math problems and is aimed at developing readers' geometric thinking to master the skills of solving solid geometry problems. Written in a friendly manner, it discusses many important and sometimes overlooked topics about polyhedra such as their cross sections, unfolding, inscribed and circumscribed solids and figures of revolution. Over 350 unique problems with detailed solutions and hints are presented throughout the text, many of which are solved in multiple ways to aid readers with different mathematical backgrounds. If the problem is of historical significance or can be related to a similar problem solved in ancient times, its original solution, historical information about its creation and origin of its methods are also included. Various applications of stereometry are also explored, including those to chemistry, molecular structures and crystallography. For example, using Euler's formula for a convex polyhedron, the reader will learn how to explain the structure of various chemical compounds such as how to predict the shape of the truncated icosahedron for the C₆₀ fullerene molecule, the most powerful antioxidant known today, and to prove why the surface of any fullerene C_{2n} consists of $n/10$ regular hexagons and always only 12 regular pentagons. Demonstrating the connections between different areas of mathematics, *Methods of Solving Solid Geometry Problems* will be of interest to students who want to excel in math competitions and to those who aspire for greater mastery in linear algebra, analytic geometry, calculus and more advanced topics. It can also be used by teachers to stimulate abstract thinking and bring out the originality of their students. **Grade 7 Common Core**

A History of Chinese Mathematics Jean-Claude Martzloff, 2007-08-17 Since the end of the 19th century a number of specialised journals albeit with a large audience have regularly included articles on the history of Chinese mathematics while a number of books on the history of mathematics include a chapter on the subject. Thus the progressive increase in our knowledge of the content of Chinese mathematics has been accompanied by the realisation that as far as results are concerned there are numerous similarities between Chinese mathematics and other ancient and medieval mathematics. For example Pythagoras theorem the double false position rules Hero's formulae and Ruffini Harner's method are found almost everywhere. As far as the reasoning used to obtain these results is concerned the fact that it is difficult to find rational justifications in the original texts has led to the reconstitution of proofs using appropriate tools of present day elementary algebra. Consequently the conclusion that Chinese mathematics is of a fundamentally algebraic nature has been ventured. However in recent decades new studies particularly in China and Japan have adopted a different approach to the original texts in that they have considered the Chinese modes of reasoning as these can be deduced from the rare texts which contain justifications. By studying the results and the methods explicitly mentioned in these texts hand in hand this Chinese and Japanese research has attempted to reconstruct the conceptions of ancient authors within a given culture and period without necessarily involving the convenient but often distorting social and conceptual framework of present day mathematics. **Differentiating**

European and Chinese Cognitive Styles and their Impact on Teaching Mathematics Filippo Spagnolo, Benedetto Di Paola, 2010-04-05
