

Scores for a common standardized college aptitude test are normally distributed with a mean of $\mu = 487$ and a standard deviation of $\sigma = 104$. Randomly selected men are given a Test Preparation Course before taking this test. Assume, for sake of argument, that the test has no effect.

If 1 of the men is randomly selected, find the probability that his score is at least 547.

$$P(X > 547) = \boxed{}$$

If 12 of the men are randomly selected, find the probability that their mean score is at least 547.

$$P(M > 547) = \boxed{}$$

If the random sample of 12 men does result in a mean score of 547, is there strong evidence to support the claim that the course is actually effective? (We will use a threshold of 0.05 for unusual results.)

- ☐ No. The probability indicates that is is possible by chance alone to randomly select a group of students with a mean as high as 547.
- ☒ Yes. The probability indicates that is is unlikely that by chance, a randomly selected group of students would get a mean as high as 547.
