coolant core melt and containment integrity loss to name a few were all at one time topics of protracted discussions on hypothesized events. Historically many of these have become multiyear large scale research programs aimed at resolving the what ifs. For the topic of anticipated and abnormal plant transients however the searching questions and the research were not so prolific until the mid 1970s. At that time probabilistic risk methodologies began to tell us we should change our emphasis in reactor safety research and development and focus more on small pipe breaks and plant transients. Three Mile Island punctuated that message in 1979. The plant transient topic area is a multidisciplinary subject involving not only the nuclear fluid flow and heat transfer technologies but also the synergistics of these with the reactor control systems the safety systems operator actions maintenance and even management and the economic considerations of a given plant.
