*Acceptance of Stay Cable Systems Using Prestressing Steels* fib Fédération internationale du béton,2005-01-01 This fib Recommendation gives technical guidelines regarding design testing acceptance installation qualification inspection and maintenance of stay cable systems using prestressing steels strands wires or bars as tensile elements which can be applied internationally This Recommendation is applicable for cable stayed bridges and other suspended structures such as roofs It may also be used for hangers in arch structures and as suspension cables as appropriate This Recommendations has been formulated by an international working group comprising more than 20 experts from administrative authorities universities laboratories owners structural designers suppliers of prestressing steels and stay cable suppliers The text has been written

to cover best construction practices around the world and to provide material specifications that are considered to be the most advanced available at the time of preparing this text For ease of use for client designer and cable supplier the complex content has been arranged thematically according to the system components into chapters focusing on performance characteristics requirements and acceptance criteria Requirements and comments have been specified for all parties involved in design and construction in order to aim for a uniform and high quality and durability The interfaces to the structural designer are highlighted The essential subjects are Design and detailing of stay cables including saddles and damping devices Durability requirements and corrosion protection systems Requirements for the materials Testing requirements for the stay cables Installation tolerances qualification of companies and personnel Inspection maintenance and repair This Recommendation does not cover the technology of stay cables whose tensile elements are ropes locked coil cables etc or which consist of composite materials Nevertheless in many cases the specified performance criteria may also be applicable to these systems although numerical values given for the acceptance criteria may need to be adjusted For these systems it has been difficult to provide multiple protective layers similar to those specified for stay cables made from prestressing steel and therefore the quality of corrosion protection may not be equivalent While extradosed cables have similarities with stay cables generally agreed design and system acceptance criteria are not yet available and therefore this type of cable is not covered

Hewson,2003 Prestressed concrete decks are commonly used for bridges with spans between 25m and 450m and provide economic durable and aesthetic solutions in most situations where bridges are needed Concrete remains the most common material for bridge construction around the world and prestressed concrete is frequently the material of choice Extensively illustrated throughout this invaluable book brings together all aspects of designing prestressed concrete bridge decks into one comprehensive volume The book clearly explains the principles behind both the design and construction of prestressed concrete bridges illustrating the interaction between the two It covers all the different types of deck arrangement and the construction techniques used ranging from in situ slabs and precast beams segmental construction and launched bridges and cable stayed structures Included throughout the book are many examples of the different types of prestressed concrete decks used with the design aspects of each discussed along with the general analysis and design process Detailed descriptions of the prestressing components and systems used are also included Prestressed Concrete Bridges is an essential reference book for both the experienced engineer and graduate who want to learn more about the subject      *Durability of Post-tensioning Tendons* fib Fédération internationale du béton,2001-01-01 In some countries durability problems with post tensioning tendons have in the past led to fairly restrictive regulations Improvements to execution procedures have been developed

since and new or improved prestressing systems have been proposed too This development was of course subject of discussions in fib Commission 9 Reinforcing and Prestressing Materials and Systems and in IABSE Working Commission 3 Concrete Structures It was decided to organise a workshop with the aim to review the different aspects of the problems encountered and to discuss solutions available today Keynote speakers from various countries were invited to contribute Their papers are published in this bulletin grouped together under the following themes Inventory and condition 6 papers Investigation and repair 5 papers Technical progress 4 papers Strategies for improvement 6 papers Supported by the international federation for structural concrete fib and the international association for bridge and structural engineering IABSE the workshop took place on 15 16 November 2001 at Ghent University celebrating the 75th anniversary of the Magnel Laboratory for Concrete Research whose director also chaired the Scientific Committee and edited the bulletin It needs to be emphasised that in the bulletin invited experts present their individual views Although not yet discussed in any of the association's working bodies the highly topical contents of the bulletin is believed to be of general interest to fib's members and to document a starting point for future work in this field Therefore the Council of fib agreed to exceptionally publish these papers within fib's series of Bulletins
