

Volcanoes and Other Igneous Activity

ENR 200 - Chapter 10a

Volcanoes

- Some volcanoes erupt violently (Mt. St. Helens) while others erupt gently (Kilauea)
- The violence of an eruption is due to the viscosity of the magma, which depends upon:
 - Magma's composition
 - Magma's temperature
 - Amount of dissolved gases
- The more viscous the magma, the more violent the eruption

Composition

- Most of the igneous rock will have varying amounts of silica content (Silica has two forms: granitic and basalt)
- A magma's viscosity is directly related to its silica content (high viscosity, the high amount of silica)

Temperature

- The hotter the magma, the more violent it will be
- Magma can produce dyke vents, hot gas vents (the hotter the dyke, the hotter it is)

Dissolved Gases

- Magma has the potential composition to be magmatic
- Most of the dissolved gas is water vapor
- Highly viscous magma trap gases until they reach an eruption

What is extruded during volcanic eruptions?

- Lava flows
- Gases
- Pyroclastic materials
