SynerGEE GAS

Is the gas delivery system you're looking at able to meet your power generation needs: a hydraulic engineer's perspective

AUTHOR: S. Alex Hollis, Jr., P.E., DNV GL

DATE: May 2014

ABSTRACT

The hydraulic characteristics, and system response to demands and supplies, of natural gas pipelines are substantially different from the flow characteristics of electric transmission systems. Pipelines must incorporate consideration of packing and drafting phenomena into their analyses. This is especially true for gas consumed in conjunction with electrical generation requirements, which typically exhibit sudden and substantial demands. These demands can cause pressure problems in the gas pipeline.

The pipeline controller must take this demand nature into account when planning pipeline operations, and should perform careful hydraulic analysis to determine the adequacy of his or her system to meet demands, the impact these demands have on both short- and long-term operations, and the environmental and safety issues involved.

This paper discusses the flow characteristics of natural gas pipelines, the phenomenon of line pack and subsequent draft, and related operational issues. Both steady-state and unsteady-state (transient) flow characteristics are covered, and some typical techniques for dealing with power generation demands are discussed.

INTRODUCTION AND PURPOSE

The natural gas industry has seen, in the past few years, substantial increases in the amount of natural gas being used as fuel for electric power generation. The nature of electrical demand and consumption yields three points that are key to understanding the operating problems caused by natural gas consumption:

- electrical generation usage is characterized by sudden large changes in demand,
- demand changes are usually requested with very short lead times, and
- gas must be delivered at a reasonably high pressure.
