Spatio-Temporal Modeling and Device Optimization of Passively Mode-Locked Semiconductor Lasers Stefan Meinecke, 2022-03-26 This thesis investigates passively mode locked semiconductor lasers by

numerical methods The understanding and optimization of such devices is crucial to the advancement of technologies such as optical data communication and dual comb spectroscopy The focus of the thesis is therefore on the development of efficient numerical models which are able both to perform larger parameter studies and to provide quantitative predictions Along with that visualization and evaluation techniques for the rich spatio temporal laser dynamics are developed these facilitate the physical interpretation of the observed features The investigations in this thesis revolve around two specific semiconductor devices namely a monolithically integrated three section tapered quantum dot laser and a V shaped external cavity laser In both cases the simulations closely tie in with experimental results which have been obtained in collaboration with the TU Darmstadt and the ETH Zurich Based on the successful numerical reproduction of the experimental findings the emission dynamics of both lasers can be understood in terms of the cavity geometry and the active medium dynamics The latter in particular highlights the value of the developed simulation tools since the fast charge carrier dynamics are generally not experimentally accessible during mode locking operation Lastly the numerical models are used to perform laser design explorations and thus to derive recommendations for further optimizations

Dispersion in Heterogeneous Geological Formations Brian Berkowitz, 2013-06-29 In spite of many years of intensive study our current abilities to quantify and predict contaminant migration in natural geological formations remain severely limited The heterogeneity of these formations over a wide range of scales necessitates consideration of sophisticated transport theories The evolution of such theories has escalated to the point that a review of the subject seems timely While conceptual and mathematical developments were crucial to the introduction of these new approaches there are now too many publications that contain theoretical abstractions without regard to real systems or incremental improvements to existing theories which are known not to be applicable This volume brings together articles representing a broad spectrum of state of the art approaches for characterization and quantification of contaminant dispersion in heterogeneous porous media Audience The contributions are intended to be as accessible as possible to a wide readership of academics and professionals with diverse backgrounds such as earth sciences subsurface hydrology petroleum engineering and soil physics

An Introduction to Computational Physics Tao Pang, 2006-01-19 Thoroughly revised for its second edition this advanced textbook provides an introduction to the basic methods of computational physics and an overview of progress in several areas of scientific computing by relying on free software available from CERN The book begins by dealing with basic computational tools and routines covering approximating functions differential equations spectral analysis and matrix operations Important concepts are illustrated by relevant examples at each stage The author also discusses more advanced topics such as molecular dynamics modeling continuous systems Monte Carlo methods genetic algorithm and programming and numerical renormalization It includes many more exercises This can be used as a textbook for either undergraduate or first year graduate courses on computational physics or scientific computation It will also be a useful reference for anyone involved in computational
