Body Composition

The Muscular System

The main function of the muscular system is movement. This includes walking, breathing, pumping the heart, swallowing food through your digestive tract, just to name a few examples. Skeletal sites are attached to the bones, helping to maintain a consistently long stature. Skeletal muscle makes up nearly half of an individual's bodyweight. Skeletal muscles are individual segments up of muscle fibers, myofibrils, sarcomeres, and connective tissue. There are three types of skeletal muscle: skeletal, cardiac, and smooth.

Skeletal Muscle

Approximately 80% skeletal muscles are attached to bones by tendons.

Skeletal muscles contract voluntarily, meaning that you can control them.

Voluntary skeletal muscle cells appear to be tapered (cone) like structures. Axons and dendrites are called axons. Axons and dendrites are attached to the motor unit. When they contract, they pull the attachment points closer to each other.

Tendons are made up of extremely tough collagen fibers in the form of dense regular connective tissue. They attach to skeletal muscle fibers, connect them and are important to bones in the body. Tendons have a large degree of strain when a muscle contracts. When laboratory skeletal muscles are used, the location, shape, and number are important. The location is the area where the muscle is found, the shape is the point where the muscle contracts to a maximum force, and the number is the point where the muscle contracts to a maximum force.

Cardiac Muscle

Cardiac muscle is only found in the heart and continuously contracts and relaxes to pump blood through the blood vessels of the body. Cardiac muscle contracts continuously, meaning that it never stops working when they contract. This heart has a very specialized structure that allows for a continuous contraction of cardiac muscle. Cardiac muscle fibers are striated, striated muscle, but they have a very different internal structure. These fibers are very different from skeletal muscle fibers in that they are very different, allowing cardiac muscle to be striated in great amounts of pressure and force even in a small amount of time.

Smooth Muscle

Smooth muscle, also known as involuntary, is the muscle that is found in the walls of the digestive tract, the respiratory tract, the urinary tract, the reproductive tract, and the circulatory system. Smooth muscle contracts continuously, meaning that it never stops working when they contract. This muscle is found in the walls of the digestive tract, the respiratory tract, the urinary tract, the reproductive tract, and the circulatory system. Smooth muscle contracts continuously, meaning that it never stops working when they contract.
