Burke,Suzy Fox,2016-05-13

Every day we hear stories about the consequences of human frailties for individuals their families and friends and their organizations Some of these stories are about alcohol and drug addiction and other harmful lifestyle choices but human frailty also leads to all kinds of unethical and illegal behaviour Individuals are convicted of bribery and corruption price fixing theft and fraud sexual harassment and abuse of authority Politicians fiddle their expenses sports people cheat and fix matches and school and university students and teachers cheat to enhance exam results Studies have shown that business students cheat more than others and efforts to teach ethical behaviour in business schools make little difference The media who bring us stories of others frailties themselves engage in unethical and illegal conduct in pursuit of an edge over their rivals The contributions to this latest addition to Gower's Psychological and Behavioural Aspects of Risk Series place the spotlight on individuals their behavioural choices and the consequences that follow for theirs and others lives and careers The conclusion is that people do have choices and options and that whilst there are no easy or quick fixes in addressing self limiting behaviours successful

Genomic “dark matter”: implications for understanding human disease mechanisms, diagnostics, and cures Philipp Kapranov, The vast majority of the human genome has been historically ignored from the point of view of molecular mechanisms of disease diagnostics and potential therapeutic targets The predominant focus of disease research has traditionally been placed on the protein coding regions of the human genome which account for only 4 5% of its total sequence complexity This bias has an obvious underlying reason protein coding regions encode a crucial class of molecules in a cell whose function and importance are well established Furthermore proteins are the predominant class of cellular molecules against which effective therapeutics can be designed This bias pervades the design of analytical tools made to measure DNA DNA protein interactions as well as procedures used to measure and annotate transcriptome expression Microarrays for example are often biased to the regions of genome known to encode exons or promoters of protein coding mRNAs Other aspects of our approach towards measuring expression of RNAs such as the typical choice of polyA RNA selection enriched in mRNAs for next generation sequencing also reinforces this bias In summary the 2 3% of the genome and RNAs made from it has dominated the conceptual thinking of academic and medical communities as well as industries that make devices that measure nucleic acids for research or diagnostic purposes and the pharmaceutical industry However during the last decade a tide of data has gained sufficient momentum to suggest that the cell actually uses the remaining 97 98% of the genome to produce stable RNAs the so called dark matter RNA The first reports to suggest this were based on tiling array technology and sequencing of ESTs which while powerful had their limitations tiling arrays could not estimate the relative mass of the RNAs produced from the non protein coding regions in a cell and the EST sequencing methods were not deep enough The advent of next generation sequencing in particular single molecule sequencing has allowed us not only confirm the previous observations but also for the first time to estimate not only from where but also how much non exonic RNA is produced Its fraction of the total transcriptome is quite significant up to 2 3 of all RNA made in a human cell <http://www.biomedcentral.com/1741-7007/8/149> Moreover the non exonic RNAs are differentially expressed in disease for example between the primary tumors and metastatic derivatives We believe that the logical next step from these observations is to ask three questions perhaps some of the most important questions of our time in biomedical science 1 do dark matter RNAs underlie mechanisms of human disease 2 Can they be used for diagnostics and 3 Can they be used as targets for therapeutics We thus would like to propose a Research Topic in the Frontiers in Genetics Frontiers in Non Coding RNAs that is specifically dedicated to publishing manuscripts addressing these three questions **Plant Pest Risk Analysis** Christina Devorshak, 2012 This text provides instruction on the concepts and application of risk analysis in the field of regulatory plant protection covering topics such as the background on why and how risk analysis is conducted and specific methods for implementing risk analysis This book also provides useful exercises and case studies to aid students of plant pathology and

crop protection in their absorption of the subject Equally useful for practitioners this book is written by experts with a wealth of national and international experience Students of plant pathology and crop protection as well as practitioners Handbook of Missing Persons Stephen J.
