Genetics**ANALYZING EXPERIMENTS**

Part of Gregor Mendel's hypotheses of inheritance proposed that when two contrasting traits occur together, one of them may be completely expressed, while the other may have no observable effect on the organism's appearance. He called the expressed trait dominant and the unexpressed trait recessive. In his genetic experiments, Mendel studied seven contrasting traits of peas. One of the traits he studied was the trait for seed shape. Mendel found that there are two forms of the trait for seed shape—wrinkled and round. In an experiment to determine which form of this trait was dominant, Mendel performed the following experiment:

- A.** Mendel allowed the plants to self-fertilize to produce the homozygous P generations.
- B.** Mendel then performed a cross between the homozygous plants with round seeds (RR) and homozygous plants with wrinkled seeds (rr) to produce the F_1 generation.
- C.** Mendel then allowed the F_1 plants to self-fertilize to produce the F_2 generation.
- D.** Mendel analyzed the results of the crosses to determine the genotypes and phenotypes present.

Use the information above to answer questions 1–5.

1. To determine the results of this experiment, complete the Punnett squares below by writing the correct allele(s) in the space provided.

Freeman has published by the Griffiths author team implements an innovative approach to teaching genetics Rather than
presenting material in historical order Modern Genetic Analysis Second Edition integrates molecular genetics with classical
genetics The integrated approach provides students with a concrete foundation in molecules while simultaneously building
an understanding of the more abstract elements of transmission genetics Modern Genetic Analysis Second Edition also
incorporates new pedagogy improved chapter organization enhanced art and an appealing overall design **Sewall Wright**

Wright's life and influence which is accompanied by a very useful collection of Wright's papers on evolution is the best we
have for any recent figure in evolutionary biology Joe Felsenstein Nature In Sewall Wright and Evolutionary Biology Provine
has produced an intellectual biography which serves to chart in considerable detail both the life and work of one man and the
history of evolutionary theory in the middle half of this century Provine is admirably suited to his task The resulting book is
clearly a labour of love which will be of great interest to those who have a mature interest in the history of evolutionary

Quantitative traits be they morphological or physiological characters aspects of behavior or genome level features such as
the amount of RNA or protein expression for a specific gene usually show considerable variation within and among
populations Quantitative genetics also referred to as the genetics of complex traits is the study of such characters and is
based on mathematical models of evolution in which many genes influence the trait and in which non genetic factors may
also be important Evolution and Selection of Quantitative Traits presents a holistic treatment of the subject showing the
interplay between theory and data with extensive discussions on statistical issues relating to the estimation of the biologically
relevant parameters for these models Quantitative genetics is viewed as the bridge between complex mathematical models of
trait evolution and real world data and the authors have clearly framed their treatment as such This is the second volume in a
planned trilogy that summarizes the modern field of quantitative genetics informed by empirical observations from wide
ranging fields agriculture evolution ecology and human biology as well as population genetics statistical theory mathematical
modeling genetics and genomics Whilst volume 1 1998 dealt with the genetics of such traits the main focus of volume 2 is on

their evolution with a special emphasis on detecting selection ranging from the use of genomic and historical data through to ecological field data and examining its consequences
