

SOLVED PROBLEMS

1. A parallel beam of light of $6000\text{\AA}$ is incident on a thin glass plate of refractive index 1.5 such that the angle of refraction into the plate is 50° . Find the least thickness of the glass plate which will appear dark by reflection.

Given data Wavelength of the given light $\lambda = 6000\text{\AA} = 6000 \times 10^{-8} \text{ cm}$
Refractive index of the glass plate $\mu = 1.5$
Angle of refraction $r = 50^\circ$

Solution $2\mu t \cos r = n\lambda$

For least thickness, $n = 1$

$$\text{Thickness } t = \frac{n\lambda}{2\mu \cos r}$$

$$t = \frac{1 \times 6000 \times 10^{-8}}{2 \times 1.5 \times \cos 50^\circ}$$

$$t = \frac{6 \times 10^{-5}}{3 \times 0.6428} = 3.1114 \times 10^{-5} \text{ cm}$$
$$= 3.11 \times 10^{-5} \text{ cm}$$

2. In a Newton's rings experiment, the diameter of the 5th ring is 0.30 cm and the diameter of the 15th ring is 0.62 cm. Find the diameter of the 25th ring.

Given data Diameter of the 5th ring = 0.3 cm
Diameter of the 15th ring = 0.62 cm

Theory and Problems of Optics Eugene Hecht, 1975 Problems And Solutions On Optics (Second Edition) Swee Cheng Lim, Choy Heng Lai, Leong-chuan Kwek, 2019-09-24 This volume is a compilation of carefully selected questions at the PhD qualifying exam level including many actual questions from Columbia University University of Chicago MIT State University of New York at Buffalo Princeton University University of Wisconsin and the University of California at Berkeley over a twenty year period Topics covered in this book include geometrical optics quantum optics and wave optics This latest edition has been updated with more problems and solutions bringing the total to over 200 problems The original problems have been modernized and outdated questions removed placing emphasis on those that rely on calculations The problems range from fundamental to advanced in a wide range of topics on optics easily enhancing the student s knowledge through workable exercises Simple to solve problems play a useful role as a first check of the student s level of knowledge whereas difficult problems will challenge the student s capacity on finding the solutions **The Monte Carlo Methods in Atmospheric Optics** G.I. Marchuk, G.A. Mikhailov, M.A. Nazareliev, R.A. Darbinjan, B.A. Kargin, B.S. Elepov, 2013-04-17 This monograph is devoted to urgent questions of the theory and applications of the Monte Carlo method for solving problems of

atmospheric optics and hydrooptics The importance of these problems has grown because of the increasing need to interpret optical observations and to estimate radiative balance precisely for weather forecasting Inhomogeneity and sphericity of the atmosphere absorption in atmospheric layers multiple scattering and polarization of light all create difficulties in solving these problems by traditional methods of computational mathematics Particular difficulty arises when one must solve nonstationary problems of the theory of transfer of narrow beams that are connected with the estimation of spatial location and time characteristics of the radiation field The most universal method for solving those problems is the Monte Carlo method which is a numerical simulation of the radiative transfer process This process can be regarded as a Markov chain of photon collisions in a medium which result in scattering or absorption The Monte Carlo technique consists in computational simulation of that chain and in constructing statistical estimates of the desired functionals The authors of this book have contributed to the development of mathematical methods of simulation and to the interpretation of optical observations A series of general method using Monte Carlo techniques has been developed The present book includes theories and algorithms of simulation Numerical results corroborate the possibilities and give an impressive prospect of the applications of Monte Carlo methods
