

Experiment 1a:

Aim: To develop a MATLAB code for computation of Pathloss between the transmitter and receiver in wireless environment.

Theory:

The path loss, which represents signal attenuation as a positive quantity measured in dB, is defined as the difference between the effective transmitted power and the received power, and may or not include the antenna gains. The path loss for the free space model when antenna gains are included is given by

$$PL(dB)=10\log(P_t/P_r)=-10\log[G_t G_r \lambda^2/(4\pi)^2 d^2]$$

When antenna gains are excluded, the antennas are assumed to have unity gain, and path loss is given by

$$PL(dB)=10\log(P_t/P_r)=-10\log[\lambda^2/(4\pi)^2 d^2]$$

The Friis free space model is only a valid predictor for P_r for values of d which are in the far-field region of the transmitting antenna i.e the region beyond the far field distance d_f , which is related to the largest linear dimension(D) of the transmitting antenna aperture and the carrier wavelength.

$$d_f=2D^2/\lambda$$

Program:

```
% This program calculate the Free Space Propagation Loss %with assumption of unity antenna gain

f = input('Enter carrier frequency:');
c = 3*10^8;
