

OPERATION

1. Start boiler in accordance with lighting instruction plate on boiler control panel.
2. Adjust primary air shutter on main gas burner as to obtain proper gas flame. The sharp blue cones should be about $\frac{1}{8}$ " long on natural gas and about $\frac{1}{4}$ " long on manufactured gas. Check all connections for gas leakage with a soap and water solution. (See also G-55 "Operation", Step 5-7.)

NOTE: Built in expansion chamber in HYDRO-TANK is adequate for modern baseboard, convactor and radiant panel systems. If HYDROTHERM boiler with Trim "HT" is used on large water content conversion installation, additional expansion facilities must be provided.

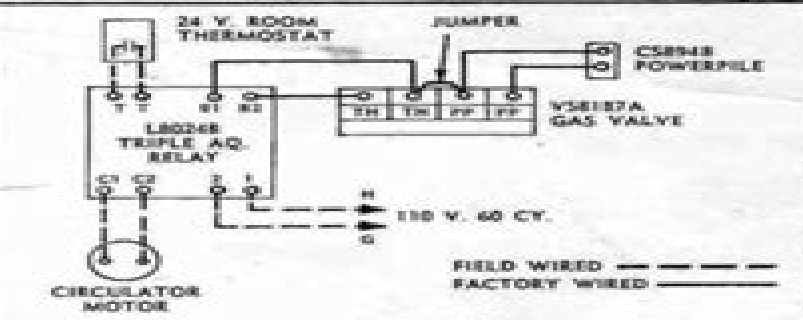

WIRING DIAGRAM FOR HYDROTHERM "DUO-SERVICE" SYSTEMS

HYDROTHERM "DUO-SERVICE" systems are equipped with self-energizing boiler controls thereby assuring full domestic water service and partial heating in the event of power failure. Shown below are the simple electrical field connections required.

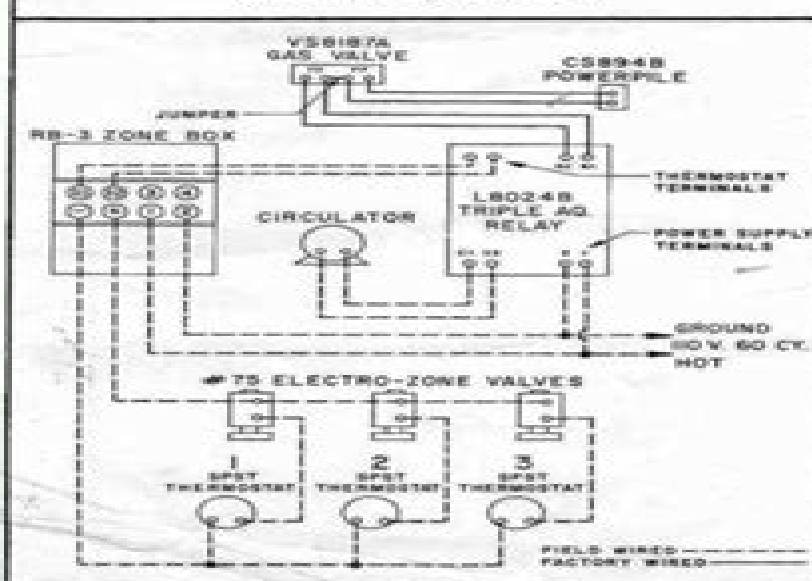

- CONTROL SEQUENCE**
1. Gas valve and high limit are wired to maintain boiler water temperature. Thermostat, however, will shut off only when boiler water reaches high limit setting. Set high limit at 200°. During minimum operation, setting may be lowered to 180°.
 2. Thermostat controls circulation. Circulator continues to run until thermostat is satisfied.
 3. In case of power failure, system will continue to supply domestic hot water. Bleeding this gravity flow will be obtained by opening flow control valve on top of HYDRO-TANK.

(Figure 2)
SINGLE ZONE USING
COMBINATION AQUASTAT RELAY

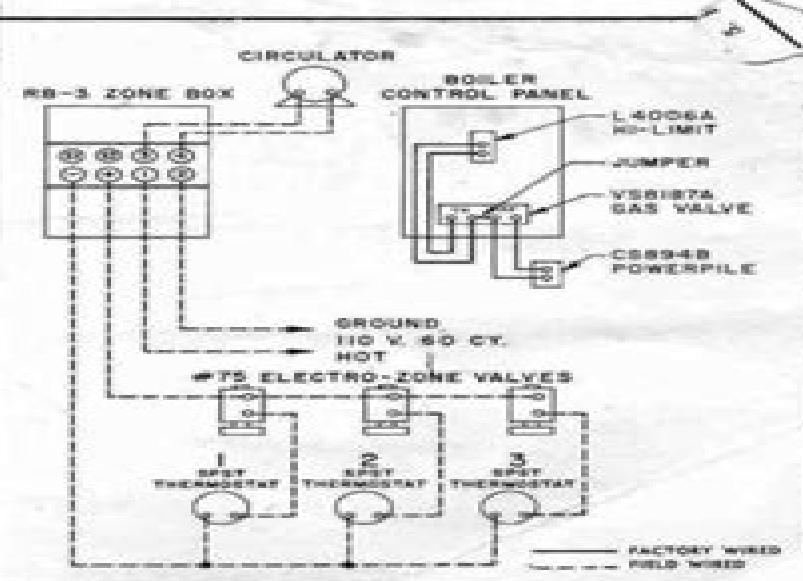

- CONTROL SEQUENCE**
1. The low limit controller maintains boiler water temperature for domestic hot water service. This should be set at 180° with a 1/2" F. differential.
 2. The thermostat controls the circulator relay and it will run whenever the thermostat calls for heat provided the boiler water temperature is above the low limit setting.
 3. The high limit controller shuts off the burner if the boiler water temperature exceeds its setting. Set at 210°.
