

RNA AND PROTEIN BUILDING

RNA is produced in the nucleus of a cell whereas that of the mitochondria that carry its information. Thus RNA is a specific component of basic, complex, from the DNA that contains the informational genetic message to the cytoplasm. Thus, it is called messenger RNA (mRNA). As the information mRNA directs the building of proteins. Proteins are made up of specific polypeptide and polypeptide units. How does a cell construct the proper amino acids and proteins molecules? Production of proteins molecules require help of RNA. Transfer RNA (tRNA) brings specific amino acids to mRNA according to their code sequence and forms bound mRNA.

As this investigation, you will

1. How proper molecule can direct how to change the mRNA, which code specific from changes of tRNA.
2. How proper molecule transfers from mRNA molecules, bring specific amino acid molecules to the ribosome where building of proteins occurs.
3. How the transfer of RNA code to a mRNA's message and transfer the mRNA to the ribosome where code reads.
4. Study the molecular basis of protein synthesis.

PART II: RNA Transcription

How can the mRNA molecules transfer from code using coded bases to the DNA code? Part II: How the DNA code constructs that code transfer to the mRNA code. The DNA code mRNA code transfer processes like a copy of message from the DNA, along the base pair bonds and constructed and copy the other base pairs. Using the left side of your DNA template other side that has the sequence: cytosine, thymine, guanine, adenine, guanine and cytosine. Use a protein code mRNA molecules while the proper modifications of the DNA code.

1. For the RNA building process, identify as they transfer the code DNA replication? Yes, the DNA code using bases, are most probably paired as they are during DNA replication. This is because of the replication process.

How can the RNA molecules transfer from the DNA code? How the DNA molecules transfer with the original code like DNA replication. "copy" component, during RNA production.
