the vertical dynamics a switching control logic called MiniMax controller is used It is named after the fact that it changes only from soft to hard damping and vice versa A control quantity was identified that connects the vertical dynamics with the longitudinal dynamics the integral of dynamic wheel load The control algorithm is implemented in a compact class passenger car Simulations with a quarter car model have been undertaken as well as tests on a 4 post test rig driving tests with defined excitations like defined obstacles and test drives on a real road using a braking machine for reproducibility reasons It could be shown that it is possible to reduce the braking distance by affecting on the vertical dynamics of a passenger car in general The amount of reduction depends on the elevation profile of the chosen testing track and on the initial velocity On a road with an unevenness comparable to the one that is found on a typical German Autobahn a reduction of typically 1 2% compared to the best passive damping was achieved
