of Male Reproduction is a collection of papers that deals with general reproductive biology and specific aspects of reproductive toxicology pertaining to the male sex. Some papers discuss testicular organization, reproductive toxicity testing systems, and germ cell genetic toxicology. The use of in vitro systems by investigators to dissect the male reproductive toxicants can lead to a more scientific approach toward hazard assessment and the development of safer drugs and chemicals. Other papers explain the fundamental reproductive biology of the testis, the neuroendocrine system, the epididymis, and accessory sex organs and spermatozoal evaluation. Toxicological aspects cover the toxicological evaluation of the complete reproductive system, testicular morphology, sperm assessment, and germ cell mutagenesis. One paper describes alternative methods in toxicology by using new in vitro systems that should reduce or eliminate the need for tests conducted on animals. In vitro methodology embraces other systems such as from subcellular fractions to isolated intact organs. In relation to target organ toxicity, the researcher can focus using primary cell cultures. This collection will prove helpful to toxicologists, graduate students, and researchers in biology, particularly in male reproductive toxicology and fertility testing. **The Male**

Reproductive System (kit). Camera Talks Ltd, 1979. Male Reproductive Function and Semen T. Mann, C.

Lutwak-Mann, 2012-12-06. To present a coherent and meaningful survey of scientific research endeavour in an area that has expanded as fast as physiology and biochemistry of reproduction in the male is no mean task these days. No less prodigious than the growth of knowledge of male reproductive function has been the rate at which the outpouring of publications on this subject has continued since the appearance of *The Biochemistry of Semen* and of *The Male Reproductive Tract* in 1964. Since cyclopaedic treatment of this vast literature did not appeal to us, we have made no attempt either to rehash the material contained in that book or to enlarge the bibliography beyond the nearly 3500 references included in the present treatise. At the same time whilst writing, we felt strongly that to advance it is necessary to understand the past and for this reason we have not hesitated to refer especially in the introductory chapter to a number of those fundamental early discoveries in which today's knowledge is deeply and firmly rooted. *Male Reproductive Function* Christina Wang, 2007-05-28.

Male Reproductive Function gives an up to date review on the physiology and disease processes associated with the male reproductive system. The first few chapters describe the regulation of the functions of the testis and the integration of its components: germ cells, Sertoli cells, and Leydig cells. This is followed by a description of puberty and aging and the disorders or dysfunction that may be associated with these physiological processes. Discussions on the current methods for the diagnosis and treatment of male hypogonadism, male infertility, and male sexual dysfunction follow, with detailed descriptions of types of androgen replacement and the benefits and risks of such treatment. The book concludes with the development of male contraception and the possible influence of the environment on the male reproductive system. *Male Reproductive Function* represents a conglomeration of the efforts of experts in andrology from all over the world, both in basic cellular molecular biology as well as in clinical science and practice. This book is suitable for endocrinologists, urologists, general
