3D Modeling with Data-driven Suggestions Siddhartha Chaudhuri,2011 Creating detailed three dimensional shapes on the computer is hard The standard tools for the task are complex and require long training and familiarization As a result 3D modeling is typically the domain of the professional artist and not the casual user Professionals invest the time to master their tools but such tools are usually restricted to low level sculpting operations High level reasoning and geometric manipulation of which computers are well capable are not used to help the artist reach her goals more efficiently or creatively In this dissertation I propose techniques by which computers endowed with a greater understanding of the structure of shapes can both support the creative pursuits of professionals as well as significantly ease the burden of 3D modeling for the casual user To this end I describe methods for generating suggestions during the 3D modeling process component shapes that may be directly used to augment the currently modeled shape or to inspire directions for its further development These suggestions are drawn from a large library of previously modeled shapes Also I discuss the construction of an assembly based modeling tool that enables casual users to rapidly construct shapes from suggested components with minimal training Experiments with both professional and casual users suggest that this approach successfully supports rapid creative 3D modeling
