Support for other languages such as M, Python, and Ruby among others is available via language services installed separately. It also supports XML/XSLT, HTML/XHTML, JavaScript and CSS.

Microsoft provides "Express" editions of its Visual Studio at no cost. Commercial versions of Visual Studio along with select past versions are also available for free to students via Microsoft's DreamSpark program.

This guide is intended to get you started in developing C applications using Visual Studio.

As mentioned in the Lab 1 document, we recommend you use either Dev-C++ or Visual Studio for this module. The lab documents concentrate on Dev-C++ because it's a very simple IDE that contains only the functionality needed to complete the exercises, and it is the only IDE we officially support in terms of tech support.

However Dev-C++ is not a good choice for actual professional development. Most professional (windows based) programmers will code in Visual Studio, and so if you'd prefer to use this feature rich IDE then this guide is intended as a quick start guide.

## **Visual Studio Guide Manual:**

*Verifpal User Manual* Nadim Kobeissi, 2020-03-02 The security of cryptographic protocols remains as relevant as ever with systems such as TLS and Signal being responsible for much of the Web's security guarantees. One main venue for the analysis and verification of these protocols has been automated analysis with formal verification tools such as ProVerif, CryptoVerif and Tamarin. Indeed, these tools have led to confirming security guarantees as well as finding attacks in secure channel protocols including TLS and Signal. However, formal verification in general has not managed to significantly attract a wider audience. Verifpal is new software for verifying the security of cryptographic protocols. Building upon contemporary research in symbolic formal verification, Verifpal's main aim is to appeal more to real-world practitioners, students and engineers without sacrificing comprehensive formal verification features. In order to achieve this, Verifpal introduces a new intuitive language for modeling protocols that is much easier to write and understand than the languages employed by existing tools. At the same time, Verifpal is able to model protocols under an active attacker with unbounded sessions and fresh values and supports queries for advanced security properties such as forward secrecy or key compromise impersonation. Verifpal has already been used to verify security properties for Signal, Scuttlebutt, TLS 1.3, Telegram and other protocols. It is a community-focused project and available under a GPLv3 license. The Verifpal language is meant to illustrate protocols close to how one may describe them in an informal conversation while still being precise and expressive enough for formal modeling. Verifpal reasons about the protocol model with explicit principals Alice and Bob exist and have independent states. Easy to Understand Analysis Output When a contradiction is found for a query, the result is related in a readable format that ties the attack to a real-world scenario. This is done by using terminology to indicate how the attack could have been possible, such as through a man-in-the-middle on ephemeral keys. Friendly and Integrated Software Verifpal comes with a Visual Studio Code extension that offers syntax highlighting and soon live query verification within Visual Studio Code, allowing developers to obtain insights on their model as they are writing it.
