Quick Tutorial

- **NOTE:** Most references to functions can be found below, where you will find more info and examples.
- Use the **DisplayLine()** function to display a string to the program window.
 - This displays the output **AND** a newline character, i.e. the cursor is positioned on the next line.
 - Use the **Display()** function when you do **NOT** want a NewLine character output, i.e. when you want the cursor to stay on the same line as the output.
- Use the *string concatenation* character (&) when displaying multiple strings at once:
 - **DisplayLine("Name: " & sName)**
- Use the **ReadString()** function to allow the user to enter a string using the keyboard:
 - **sName = ReadString()**
 - Note that ReadString() must **always** be on the **right** side of an equal sign. On the left side, you must *have a variable* to store (capture) whatever string the user entered.
 - Use **ReadChar()** instead of ReadString() when you want your program to accept a single character **immediately** instead of waiting for the user to press Enter.
- Similarly, use the **ReadInteger()** function to allow the user to enter an *integer*:
 - **sAge = ReadInteger()**
 - Once again, note that ReadInteger() must **always** be on the **right** side of an equal sign. On the left side, you must *have a variable* to store (capture) whatever the user entered.
- Use the **ReadDecimal()** function to allow the user to enter a decimal number:
 - **sPrice = ReadDecimal()**
- Using the various **Formatting** functions, explained in detail in the References section of this document, you can change font color, size, bold, etc.
