How Students Write: A Linguistic Analysis Laura Louise Aull, 2020-04-01 Broad generalizations about people today are a familiar feature of first year student writing. *How Students Write* brings a fresh perspective to this perennial observation using corpus linguistics techniques. This study analyzes sentence level patterns in student writing to develop an understanding of how students present evidence, draw connections between ideas, relate to their readers, and ultimately learn to construct knowledge in their writing. Drawing on both first year and upper level student writing, the book examines the discourse of students at different points in their education. It also distinguishes between argumentative and analytic essays to explore the way school genres and assignments shape students' choices. In focusing on sentence level features such as hedges, perhaps, and boosters, this study shows how such rhetorical choices work together to open or close opportunities for thoughtful exchanges of ideas. Attention to these features can help instructors foster civil discourse, design effective assignments, and expose and question norms of higher education. *Fundamentals of Satellite Remote Sensing* Emilio Chuvieco, 2016-02-24 *Fundamentals of Satellite Remote Sensing: An Environmental Approach*, Second Edition, is a definitive guide to remote sensing systems that focuses on satellite based remote sensing tools and methods for space based Earth observation. EO It presents the advantages of using remote sensing data for studying and monitoring the planet and emphasizes co

General Technical Report PSW., 1978 **Sales Management**, 1929 **Data Abstraction and Pattern Identification in Time-series Data** Prithiviraj Muthumanickam, 2019-11-25 Data sources such as simulations, sensor networks across many application domains generate large volumes of time series data which exhibit characteristics that evolve over time. Visual data analysis methods can help us in exploring and understanding the underlying patterns present in time series data, but due to their ever increasing size, the visual data analysis process can become complex. Large data sets can be handled using data abstraction techniques by transforming the raw data into a simpler format while at the same time preserving significant features that are important for the user. When dealing with time series data, abstraction techniques should also take into account the underlying temporal characteristics. This thesis focuses on different data abstraction and pattern identification methods, particularly in the cases of large 1D time series and 2D spatio-temporal time series data which exhibit spatiotemporal discontinuity. Based on the dimensionality and characteristics of the data, this thesis proposes a variety of efficient, data adaptive, and user controlled data abstraction methods that transform the raw data into a symbol sequence. The transformation of raw time series into a symbol sequence can act as input to different sequence analysis methods from data mining and machine learning communities to identify interesting patterns of user behavior. In the case of very long duration 1D time series, locally adaptive and user controlled data approximation methods were presented to simplify the data while at the same time retaining the perceptually important features. The simplified data were converted into a symbol sequence, and a sketch based pattern identification was then used to identify patterns in the symbolic data.

using regular expression based pattern matching The method was applied to financial time series and patterns such as head and shoulders double and triple top patterns were identified using hand drawn sketches in an interactive manner Through data smoothing the data approximation step also enables visualization of inherent patterns in the time series representation while at the same time retaining perceptually important points Very long duration 2D spatio temporal eye tracking data sets that exhibit spatio temporal discontinuity was transformed into symbolic data using scalable clustering and hierarchical cluster merging processes each of which can be parallelized The raw data is transformed into a symbol sequence with each symbol representing a region of interest in the eye gaze data The identified regions of interest can also be displayed in a Space Time Cube STC that captures both the temporal and contextual information Through interactive filtering zooming and geometric transformation the STC representation along with linked views enables interactive data exploration Using different sequence analysis methods the symbol sequences are analyzed further to identify temporal patterns in the data set Data collected from air traffic control officers from the domain of Air traffic control were used as application examples to demonstrate the results
