

LAB MANUAL On Data Structures using C Lab For MCA 2nd Semester of VTU

Instructions to the Readers:

- This document is a useful material for the 2nd Semester MCA students (2013 Scheme – 13MCA26) of Visvesvaraya Technological University, Belagavi, Karnataka.
- Though these programs are compiled and verified on Turbo C compiler, they can be executed on different C compilers with little/no modifications.
- Additional explanation for the program is provided, wherever necessary. However, it is advised to know the theory concepts by referring to the respective subject notes (available in the website).
- Clarifications/suggestions are welcome!!

1. Convert a valid prefix expression into postfix expression.

Logic of the program:

- Read a valid prefix expression from the keyboard as a string variable.
- Reverse this string (use `strrev()` function)
- Read every character from the reversed prefix expression (say, *sym*)
- Store the single character *sym* into a string variable *temp* by attaching null character (`\0`) to it.
- If the *sym* is an operator (like +, - etc), pop two entries from the stack. Concatenate these two popped strings and also the *sym*. Push the concatenated string (*postfix*) (*op1+op2+sym*) into the stack.
- If the *sym* was not an operator (means, it will be an alphabet/digit) then push the *temp* into the stack.
- Repeat the above steps till the end of prefix expression (`strlen(prefix)`).
- You will get the required postfix expression in the variable *postfix*.

Note: Students are advised to give only valid prefix expression as an input to get the correct result. One can write an infix expression on a paper and convert it into prefix format manually and then it can be given as input to the program.
