and Climate Jonathan E. Martin, 2004 **Atmospheric Science: Weather and Climate** Bruce Mullan, 2019-06-06

Atmospheric science studies the Earth's atmosphere its processes and the influence of other systems on the atmosphere and vice versa The study of the weather and the climate is integral to the study of atmospheric science Meteorology is concerned with weather forecasting and studies short term weather systems that last up to a few weeks Meteorological phenomena are quantified by atmospheric variables of air pressure temperature mass flow and water vapor Climatology studies the periodicity of weather events occurring over years to millennia and long term weather patterns and changes It studies climate at local regional and global levels as well as human induced or natural factors contributing to climate change Some of the experimental instruments used in atmospheric sciences are rocketsondes weather balloons satellites radiosondes and lasers This book brings forth some of the most innovative concepts and elucidates the unexplored aspects of atmospheric science The ever growing need of advanced technology is the reason that has fueled the research in this field in recent times Researchers and students in this field will be assisted by this book **Meteorology Today** C. Dynamics of the Tropical Atmosphere and Oceans Peter J. Webster, 2020-06-08 This book presents a unique and comprehensive view of the fundamental dynamical and thermodynamic principles underlying the large circulations of the coupled ocean atmosphere system Dynamics of The Tropical Atmosphere and Oceans provides a detailed description of macroscale tropical circulation systems such as the monsoon the Hadley and Walker Circulations El Niño and the tropical ocean warm pool These macroscale circulations interact with a myriad of higher frequency systems ranging from convective cloud systems to migrating equatorial waves that attend the low frequency background flow Towards understanding and predicting these circulation systems A comprehensive overview of the dynamics and thermodynamics of large scale tropical atmosphere and oceans is presented using both a reductionist and holistic perspectives of the coupled tropical system The reductionist perspective provides a detailed description of the individual elements of the ocean and atmospheric circulations The physical nature of each component of the tropical circulation such as the Hadley and Walker circulations the monsoon the incursion of extratropical phenomena into the tropics precipitation distributions equatorial waves and disturbances described in detail The holistic perspective

provides a physical description of how the collection of the individual components produces the observed tropical weather and climate. How the collective tropical processes determine the tropical circulation and their role in global weather and climate is provided in a series of overlapping theoretical and modelling constructs. The structure of the book follows a graduated framework. Following a detailed description of tropical phenomenology, the reader is introduced to dynamical and thermodynamical constraints that guide the planetary climate and establish a critical role for the tropics. Equatorial wave theory is developed for simple and complex background flows, including the critical role played by moist processes. The manner in which the tropics and the extratropics interact is then described, followed by a discussion of the physics behind the subtropical and near-equatorial precipitation, including arid regions. The El Niño phenomena and the monsoon circulations are discussed, including their covariance and predictability. Finally, the changing structure of the tropics is discussed in terms of the extent of the tropical ocean warm pool and its relationship to the intensity of global convection and climate change.

Dynamics of the Tropical Atmosphere and Oceans is aimed at advanced undergraduate and early career graduate students. It also serves as an excellent general reference book for scientists interested in tropical circulations and their relationship with the broader climate system.
