Atlas and Dissection Guide for Comparative Anatomy Saul Wischnitzer, 2006-02-13 Ideal for undergraduate comparative anatomy courses this classic manual combines comprehensive illustrations text and a clear readable design Organisms include protochordates lamprey dogfish shark mud puppy and cat *Atlas of Outline Drawings of the Dogfish Shark, the Necturus, and the Cat* Samuel Eddy, Clarence Paul Oliver, John Pattillo Turner, 1940 *Guide to the Study of the Anatomy of the Shark, Necturus, and the Cat* Samuel Eddy, 1960 Biology, 1986 Dogfish Dissection Manual Bruce D. Wingerd, 1988 This series of complete and compact laboratory manuals leads students through every stage of the dissection process for rats rabbits frogs and dogfish Each of the manuals corresponding to specimens most often used in high school and undergraduate courses in general biology zoology physiology and comparative anatomy guides the student through a complete dissection with easy to follow directions and accurate clearly labeled illustrations Anatomical structures appear in the sequence encountered during an actual dissection First the external anatomy then the skeletal muscular digestive respiratory circulatory urogenital and nervous systems *American Scientist, the Sigma Xi Quarterly*, 1945 **Biological Abstracts** Jacob Richard Schramm, 1950-08 *Proceedings of the National Academy of Sciences of the United States of America* National Academy of Sciences (U.S.), 1978-10 *A Guide for the Dissection of the Dogfish (Squalus Acanthias)* Lawrence Edmonds Griffin, 1922 **A Guide for the Dissection of the Dog-fish** Lawrence Edmonds Griffin, 1907

Dogfish Anatomy, 2006 The Dissection of the Dogfish Edwin Chapin Starks, Lot Duncan Howard, 1926 *A Guide for the Dissection of the Dogfish (Squalus Acanthias)* Lawrence E. Griffin, 2015-06-15 Excerpt from A Guide for the Dissection of the Dogfish *Squalus Acanthias* The spindle shaped body tapers from near the middle toward both head and tail the head is flattened on both the dorsal and ventral sides while the remainder of the body is nearly round with a lateral compression which is not pronounced except in the caudal portion The general color of the back and sides is gray darkest above where the skin is spotted with scattered small round light spots The color of the upper parts shades into the yellow white of the ventral surface Can head trunk and tail regions be distinguished If so what characters determine the extent of each A little above the middle of the side of the body is the lateral line distinguished partly by color partly by being slightly elevated which extends from the back of the head to the tail Cut through the skin across the lateral line at several points along the body and notice the canal which lies in the dermis under the lateral line This is the lateral line canal which opens to the surface by numerous pores too minute to be seen and contains a series of special sense organs along its dorsal and inner surfaces Near the base of the caudal fin the lateral line canal passes into a groove which continues the lateral line to within a short distance of the edge of the fin The lateral line canal in its development begins as a groove along the side of the body which becomes closed by the fusion of its edge except in this terminal portion The open groove does not appear in *Eugaleus* In the midline of the body are two triangular dorsal fins each attached to the body for about half its length The basal portion of each is thick and muscular

and contains supporting cartilages embedded in the muscles The remainder of the fin is flexible and semi transparent horny finrays being faintly visible between the layers of skin In front of each fin is a strong spine which seems to serve both as a cutwater and a weapon of defense Eugaleus has no spines The broad paired pectoral fins having the general characteristics of the dorsals spring from the ventral edges of the body just back of the head A hard bar of cartilage connecting the bases of the pectoral fins can be felt through the skin of the ventral surface of the body This is the ventral part of the pectoral girdle Farther back and also on the ventral surface are the paired pelvic fins The pelvic girdle can be felt through the skin between the bases of these fins If the specimen is a male it will have a fingerlike process projecting backward from the base and along the inner side of each pelvic fin These organs which attain a considerable size in adults are modified portions of the pelvic fin used as copulatory organs They are named variously claspers myxopterygia or pterygopodia A groove runs along the dorsal side of the clasper from the tip to near the base where it opens into a long sac glandula pterygopodia extending some distance in front of the pelvic fins just within the skin of the ventral surface By feeling a cartilaginous axis of the clasper can be discovered which extends to the tip of the organ On the dorsal surface and near the end of the clasper is a sharp grooved spine on the outer side and a strongly recurved hook on the inner side both almost hidden by a flap projecting from the inner edge of the groove This flap is stiffened by a series of small cartilages similar to the radial cartilages in the bases of the fins About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com)
