

## Chapter 7 – Memory Management

## True / False Questions

1. T / F – In a multiprogramming system, main memory is divided into multiple partitions: one for the operating system (resident monitor, kernel) and one for the set of processes currently being executed.
2. T / F – The task of subdividing memory between the OS and processes is performed automatically by the OS and is called relocation.
3. T / F – The practice in which a program and data are organized in such a way that various modules can be assigned the same region of memory is called overlaying.
4. T / F – The concept of virtual memory is based on one or both of two basic techniques: segmentation and paging.
5. T / F – A major problem with the largely obsolete Fixed Partitioning memory management technique is that of external fragmentation.
6. T / F – The problem of internal fragmentation can be lessened in a system employing a fixed-partition memory management scheme by using unequal size partitions.
7. T / F – In the Dynamic Partitioning technique of memory management, the best-fit placement algorithm is usually the best performer of the available algorithms.
8. T / F – In the Dynamic Partitioning technique of memory management, compaction refers to stuffing the processes into a contiguous block, resulting in all the free memory aggregated into a single block.
9. T / F – In the Dynamic Partitioning technique of memory management, the first-fit placement algorithm scans memory from the location of the last placement and chooses the first available block it finds that satisfies the request.
10. T / F – The Buddy System is a reasonable compromise to overcome the disadvantages of both the fixed and variable partition schemes.
11. T / F – A physical memory address is a reference to a memory location independent of the current assignment of data to memory.
12. T / F – A memory system employing paging may suffer slightly from internal fragmentation and experiences no external fragmentation.

13. T / F – In a memory system employing paging, the chunks of a process (called frames) can be assigned to available chunks of memory (called pages).
14. T / F – A memory system employing segmentation may suffer slightly from external fragmentation and experiences no internal fragmentation.
15. T / F – A memory system employing segmentation consists of a number of user program segments that must be of the same length and have a maximum segment length.

## Multiple Choice Questions

1. The task of subdividing memory between the OS and processes is performed automatically by the OS and is called:
  - a. Protection
  - b. Relocation
  - c. Memory Management
  - d. All of the above
2. The concept of Memory Management satisfies certain system requirements, including:
  - a. Protection
  - b. Relocation
  - c. Physical organization
  - d. All of the above
3. The practice in which a program and data are organized in such a way that various modules can be assigned the same region of memory is called:
  - a. Overlaying
  - b. Sharing
  - c. Relocation
  - d. None of the above
4. The concept of virtual memory is based on one or both of two basic techniques:
  - a. Overlaying and relocation
  - b. Segmentation and paging
  - c. Segmentation and partitioning
  - d. None of the above
5. A problem with the largely obsolete Fixed Partitioning memory management technique is that of:
  - a. Allowing only a fixed number of Processes
  - b. Inefficient use of memory
  - c. Internal fragmentation
  - d. All of the above
6. The problem of internal fragmentation can be lessened in systems employing a fixed-partition memory management scheme by using:
  - a. Random size partitions
  - b. Equal size partitions
  - c. Unequal size partitions
  - d. None of the above
7. In the Dynamic Partitioning technique of memory management, the phenomenon that results in unused blocks of memory outside of existing partitions is called:
  - a. Internal fragmentation
  - b. External fragmentation
