

# 5 GAMING ADDICTION AND INTERNET GAMING DISORDER

MARK D. GRUBBS\*

Gaming addiction and internet gaming disorder (IGD) has become a topic of increasing research interest. The last decade has witnessed a remarkable increase in the number of empirical studies examining various aspects of gaming addiction, video game play and video game addiction.<sup>1</sup> This chapter begins with a brief history of how research into video game addiction has changed over time (i.e., the 1980s, 1990s, and 2000s). The chapter then discusses the three disorder (i.e., the 1980s, 1990s, and 2000s). The chapter then discusses the contemporary research literature by analyzing the prevalence of video game addiction, factors associated with video game addiction, and the treatment of video game addiction.

## Gaming Addiction in the 1980s

Following the release of the first commercial video games in the early 1970s, it took until the 1980s for the first reports of video game addiction to appear in the psychological and psychiatric literature. In the early 1980s, Ross, Finerman, and Lavin<sup>2</sup> reported their cases of 'space invaders obsession' and Noller<sup>3</sup> described a similar phenomenon but called it 'computer catatonia'. Arguably the first reference to 'video game addiction' was by Soper and Miller,<sup>4</sup> who, based on their observations at school counselors, claimed the disorder was like any other

addiction and consisted of a compulsive behavioral requirement to play video games to the exclusion of other activities and a preoccupation with gaming. Subsequent studies, such as those by Ross et al.,<sup>5</sup> the first to use a structured interview about gaming to rate the behavior (i.e., the 'video game addiction scale'),<sup>6</sup> and those by Noller<sup>7</sup> and Soper and Miller<sup>8</sup> have found evidence for the existence of video game addiction. However, all of these studies used unstructured interviews, and the first study generally based on a structured interview, conducted by a particular type of video game (i.e., a computer game), was that of Soper and Miller.<sup>8</sup>

The chapter then discusses the two empirical study specifically on gaming addiction. The first study, by Ross et al.,<sup>5</sup> involved 127 people (mostly in college or young adult age range) who were asked to complete a 'video game addiction scale' (i.e., a structured interview) about gaming. The study found that video game addiction was more prevalent in those who played video games for more than 10 hours per week. The second study, by Soper and Miller,<sup>8</sup> involved 100 people who were asked to complete a 'video game addiction scale' (i.e., a structured interview) about gaming. The study found that video game addiction was more prevalent in those who played video games for more than 10 hours per week. ## Gaming Addiction in the 1990s

The 1990s saw a small but significant increase in research into video game addiction with almost all of these studies being carried out in the US and on adolescents typically surveying children in school settings.<sup>9-12</sup> In contrast to the early 1980s studies, these studies mostly examined non-stroke video game playing (i.e., home console games, handheld games, PC gaming). However, all of these studies were self-report surveys, relatively small scale and the main problem was that all of these assessed video game addiction using adapted versions of the DSM-III-R<sup>13</sup> or DSM-IV<sup>14</sup> criteria for pathological gambling. Based on further analysis of the adapted DSM criteria used, these studies were later criticized as being more likely to be assessing video game preoccupation rather than video game addiction.<sup>15</sup>

## Gaming Addiction in the 2000s

The 2000s saw a substantial growth in the number of studies on video game addiction particularly as gaming expanded into the new online medium where games could be played as part of a gaming community (i.e., Massively Multi-player Online Role-Playing Games [MMORPGs] such as World of Warcraft
