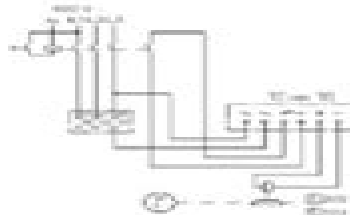

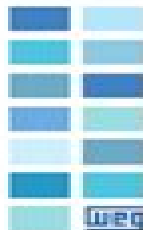

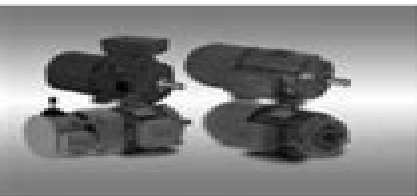

Figure 2: connection diagram of the bridge section for structural analysis (mm)

 The cable entries used for power supply and control must be fitted with components (such as cable glands and conduits) that meet the applicable standards and regulations in each country and the degree of protection indicated on the motor nameplate.

Not-used cable inlet holes in the terminal box must be properly closed with plugs in order to assure the degree of protection indicated on the motor nameplate.

For fan-cooled motors with brake, these components must be certified according to the type of protection and the Equipment Protection Level (EPL) indicated on the motor nameplate.

 The power supply from the bridge rectifier is required to release the brake. If the motor does not accelerate upon starting, turn it off and check the bridge rectifier connections. The brake coil may not be powered, if the motor still does not accelerate, contact the nearest WEG service center.

3.2. Connection Diagram

The bridge motor allows two different connections for Direct Current power supply providing either delayed or normal engagement. The connection diagrams below show the electrical connection when the bridge rectifier is supplied directly from the motor terminals:

A) Delayed engagement: The bridge rectifier of the inverter can be supplied directly from the motor terminals, without intervention, as shown in figure 7.

Figure 1. Connection diagram of the bridge rectifier for stressed employment.

3. Service Operations

When the motor is disconnected from the power supply, the current flowing through the electromagnet coil is interrupted and it stops operating. The pressure springs then push the armature towards the motor, compressing the rotor locking disc between the two friction surfaces: armature plate and endshield, thus stopping the motor.

Upon a new design, the system pulls the motor and supplies the electromagnetics and simultaneously. The armature plate is then attached to the electromagnetics frame, overcoming the spring pressure and releasing the brake disc, which obstructs safety and moves away from the friction surfaces. The locking action stops, and allows the motor to turn freely.

4. Maximum Allowed Load Inertia

The maximum cold start and the maximum cold torque indicated on table 1 must be considered for the operation of thermoprotective cooling with brakes. For brake systems to be applied on main-hazardous areas or for machines driving different loads than those shown in the table 1, contact with the
