

Chapter 8: Programming Project 2

Unlimited tries

Write a public class named `LandTract` with the following fields:

- `length` – a private `int` containing the tract's length
- `width` – a private `int` containing the tract's width

The class should also have the following methods:

- **Constructor** – The class should have a constructor with two `int` parameters. The first parameter holds the tract's length and the second parameter holds the tract's width. These values should be assigned to the `length` and `width` fields, respectively.
- **Copy Constructor** – The class should have a copy constructor that accepts another `LandTract` object as its argument. It should make the object that is being created a copy of the object that is passed as an argument.
- `getLength` – returns the value of the `length` field.
- `getWidth` – returns the value of the `width` field.
- `area` – returns the tract's area as an `int`, which is calculated by multiplying its length by its width.
- `equals` – takes another `LandTract` object as an argument and returns a `boolean` value. The method returns `true` if both tracts have the same area, or `false` otherwise.
- `toString` – returns a `String` with details about the `LandTract` object in the following format:

```
"Length: 30, Width: 40, Area: 1200"
```

(If, for example, the `LandTract` object had a length of *30* and a width of *40*, its `toString` method would return the string shown above.)
