The Water Cycle

Water flows through various pathways on our planet, shaping landscapes and sustaining life. The amount of water on Earth always stays relatively the same – it just moves from one area of the Earth's surface or atmosphere to another. Have you ever wondered how water moves from oceans to clouds to rivers and back again? That journey, known as the water cycle or hydrologic cycle, is driven by two powerful forces: the energy of the Sun and the force of gravity.

Evaporation

The water cycle begins with the warmth of the Sun heating up bodies of water such as oceans, lakes, and rivers. This heat makes some of the liquid water turn into a gas called water vapor, rising into the air. This process is called evaporation. As water vapor is added to the air, it increases the atmosphere's moisture content, or humidity. Humidity is a measure of the amount of water vapor present in the air. Warmer air can hold more moisture than cooler air, so humidity levels tend to be higher in warm and tropical climates.

Sublimation

Sometimes, water vapor can enter the atmosphere directly from a solid object, such as ice, through a process called sublimation. This often happens in cold, dry climates where the sun is strong.

Precipitation

Clouds continue to build up as more and more water vapor condenses. Eventually, the cloud droplets or ice crystals grow large enough to overcome the upward air currents that keep them suspended in the atmosphere. When this happens, the droplets or crystals begin to fall from the cloud due to gravity. Depending on the temperature and the amount of water, such as rain, snow, sleet, or hail, this is called precipitation.

When precipitation falls as rain, where the temperature may fall as rain, where the temperature is below freezing, the precipitation falls as snow. When water droplets or ice crystals reach the ground, they can soak into the soil or flow into bodies of water.

Following the precipitation, water can follow different paths: it can infiltrate the ground and become groundwater, or it can flow over the surface as runoff. This is called runoff. Runoff can flow into bodies of water, such as rivers and lakes, or it can flow over the land, where it can erode the soil and create new landforms. Runoff can also flow over the roofs of houses and buildings, where it can cause leaks and damage.

school science can capture the interest and energy of adolescent students and expand their understanding of the world around them. Resources for Teaching Middle School Science, developed by the National Science Resources Center (NSRC), is a valuable tool for identifying and selecting effective science curriculum materials that will engage students in grades 6 through 8. The volume describes more than 400 curriculum titles that are aligned with the National Science Education Standards. This completely new guide follows on the success of Resources for Teaching Elementary School Science, the first in the NSRC series of annotated guides to hands-on inquiry-centered curriculum materials and other resources for science teachers. The curriculum materials in the new guide are grouped in five chapters by scientific area: Physical Science, Life Science, Environmental Science, Earth and Space Science, and Multidisciplinary and Applied Science. They are also grouped by type: core materials, supplementary units, and science activity books. Each annotation of curriculum material includes a recommended grade level, a description of the activities involved, and of what students can be expected to learn; a list of accompanying materials; a reading level; and ordering information. The curriculum materials included in this book were selected by panels of teachers and scientists using evaluation criteria developed for the guide. The criteria reflect and incorporate goals and principles of the National Science Education Standards. The annotations designate the specific content standards on which these curriculum pieces focus. In addition to the curriculum chapters, the guide contains six chapters of diverse resources that are directly relevant to middle school science. Among these is a chapter on educational software and multimedia programs; chapters on books about science and teaching; directories and guides to science trade books and periodicals for teachers and students; another section features institutional resources. One chapter lists about 600 science centers, museums, and zoos where teachers can take middle school students for interactive science experiences. Another chapter describes nearly 140 professional associations and U.S. government agencies that offer resources and assistance. Authoritative, extensive, and thoroughly indexed, and the only guide of its kind, Resources for Teaching Middle School Science will be the most used book on the shelf for science teachers, school administrators, teacher trainers, science curriculum specialists, advocates of hands-on science teaching, and concerned parents.

Water Conservation Big Book Gr. 5-8
George Graybill, 2009-09-01. Find out why water is essential for life on Earth with our Water Conservation 3 book BUNDLE. Start by examining the water we drink with Fresh Water Resources. Build a greenhouse to see firsthand how climate change can affect fresh water. Describe how the water supply in a village could become unfit for drinking in a scenario. Next, see how climate change affects the oceans we fish with Ocean Water Resources. See how the water cycle explains why most of Earth's salt water is found in the oceans. Make your own salt water to represent Earth's oceans and experience what it would be like to visit them. Finally, visit the lakes and streams we enjoy with Waterway Habitat Resources. Become an ecologist and list factors in an aquatic ecosystem as biotic or abiotic. Find out why some aquatic organisms have a hard time adapting to climate change. Each concept is paired with hands-on activities. Written to Bloom's Taxonomy and STEAM initiatives.
